Scope

This document contains reference information about the receiver firmware.

Chapter 1 provides a set of step-by-step "how-to's" to help you find your way around the receiver's commands and logs.

Chapter 2 provides some background on the main algorithms running in the receiver and on the way to configure them.

Chapter 3 contains the complete description of the user command interface.

Chapter 4 contains the complete description of the SBF format.

Typographical Conventions

- **abc** User command name. Clicking a command name redirects to the full command description.
- abc Command argument name.
- abc Command replies.
 - SBF block name or SBF field name. Clicking an SBF block name redirects to the full SBF block description.

Chapter 1

How To...

This chapter contains step-by-step instructions to help you with typical tasks. It will help you to familiarize yourself with the receiver commands without going into too much detail.

For a comprehensive description of the command set, refer to chapter 3. You can also click on any command or SBF block name in this manual to be redirected to the full description of that command or SBF block.

You can enter user commands in many different ways:

- Commands can be accessed graphically through menus in RxControl and in the web interface (see section 1.2.4).
- Using the Data Link program provided in the RxTools suite (or any suitable terminal emulation program), you can enter commands manually through one of the receiver input ports (see section 1.2). In this chapter, user commands are referred to by their full name for readability. When typing the command, you can always use the short mnemonic equivalent to save typing effort. For instance, instead of typing setCOMSettings, you can type scs.
- You can type commands or mnemonics in the console window of RxControl (menu Tools > Expert Console) or of the web interface (menu Admin > Expert Console).

Depending on the capabilities of your particular receiver (see section 1.1), some of the user commands, SBF blocks or communication interfaces described in this document may not be supported.

1.1 Check the Capabilities of your Receiver

The capabilities of your receiver are defined by the set of enabled features. The capabilities depend on the hardware, the current firmware version and the current set of permissions. Permissions are further explained in section 1.26.

The command **getReceiverCapabilities** lists the capabilities. You can also check them using the web interface (go to *Admin >About >Permitted Capabilities*) or RxControl (go to *Help >Receiver Interface* and select the *Permitted Capabilites* tab):

Figure 1-1: Example of receiver capabilities.

1.2 Connect to the Receiver

1.2.1 Via COM Ports

A simple way to communicate with the receiver is to connect one of its COM-ports to a COM-port of your host computer. The default COM-port settings are:

Parameter	Value
baud rate	115200
data bits	8
parity	no
stop bits	1
flow control	none

The baud rate can be modified at any time by using the **setCOMSettings** command.

RxControl and Data Link can communicate with the receiver over a COM-port connection: select *Serial Connection* option when opening the connection to the receiver.

1.2.2 Via USB

The Windows USB driver provided with your receiver emulates two virtual serial ports, which can be used as standard COM ports to access the receiver. The Windows USB diver can be installed through the RxTools software suite. On Linux, the standard Linux CDC-ACM driver is suitable. Most terminal emulation programs will make no distinction between virtual and native COM ports. Note that the port settings (baud rate, etc) for virtual serial ports are not relevant, and can be left in their default configuration in the terminal emulation program.

When connecting the USB cable to a Windows PC, a new drive appears in the file manager. This drive contains an installer for the USB driver. Running this installer is not needed if you have already installed the RxTools suite. A second drive is created when the receiver is configured as a USB mass-storage device, as explained in section 1.17.

1.2.3 Via a TCP/IP Port

The receiver supports up to eight independent TCP/IP connections in parallel, through ports 28783 and 28784. Communication through port 28783 is SSL/TLS encrypted, while port 28784 uses plaintext (unencrypted) transmission. These ports can be enabled or disabled with the **setIPServices** command and their number can be changed with the **setIPPortSettings** command.

Plaintext communication is not recommended on public networks, as it can be intercepted or modified by malicious third parties. Using the encrypted IP port is advised when possible. Data exchange over the encrypted port is secured using Secure Sockets Layer (SSL) or its successor, Transport Layer Security (TLS).

By default, the receiver presents a self-signed certificate during SSL/TLS handshake, which is susceptible to man-in-the-middle attacks. Preferably, a .pem file containing a trusted certificate and its corresponding private key can be uploaded through the Communication > Web Server/TLS menu of the web interface.

In older firmware versions, anonymous users could control the receiver over a TCP/IP connection. For enhanced security, it is now mandatory to log in with a valid username and password before issuing any commands. So, after establishing a TCP/IP connection, the first command should always be **login**. See section 1.3 for details.

TCP/IP connections can be made over the following interfaces.

1.2.3.1 **Ethernet**

The receiver can be configured for dynamic or fixed IP address allocation. The default is dynamic address allocation, using the DHCP protocol. The hostname is mosaic-x5-xxxxxxx, where xxxxxxx consists of the last seven digits of the serial number of the receiver.

Dynamic IP address allocation requires the availability of a DHCP server in your local network. In the absence of a DHCP server, or when a fixed IP address is desirable, it is possible to disable the DHCP client and use a fixed address. This is done using the setIPSettings command.

Ethernet-over-USB 1.2.3.2

When a USB cable is connected, the receiver supports Ethernet-over-USB. The IP address allocated to the Ethernet-over-USB interface is 192.168.3.1. That IPv4 address cannot be changed, so that this feature is only to be used when a single receiver is connected to your computer.

By default, the receiver is not allowed to access the Internet over USB. This can be changed with the setUSBInternetAccess command. Note that this requires allowing Internet sharing on your computer. The procedure to do so depends on your operating system. For example, on Windows, it involves enabling "Allow other network users to connect through this computer's Internet connection." in the properties of the adapter providing Internet access. When Internet sharing is enabled, the receiver gets its IP address from a DHCP server on your computer. Depending on your computer's routing table, it may be that it is not reachable anymore at 192.168.3.1.

Note about the 192.168.3.1 IP address:

The receiver's TCP/IP stack is implemented with a weak host model. This means that it may react to IP packets sent to 192.168.3.1 regardless of the network interface from which the packets were received. This is true even if no USB cable is connected.

1.2.3.3 Point-to-Point Link

The receiver incorporates a point-to-point protocol server, by which it can accept TCP/IP connections over a serial link.

Configuring the point-to-point server is done with the **setPointToPoint** command. For example, to set up a point-to-point communication over COM1, with the server (i.e. the receiver) having address 192.168.60.1 and the client having address 192.168.60.2, and using CHAP authentication with password "mypwd", use this command:

```
setPointToPoint, P2PP1, Server, COM1, 192.168.60.2, 192.168.60.1,
CHAP, mypwd <CR>
```

If the client is a Linux computer, make sure the password is set in the /etc/ppp/chap-secrets file. For example, the contents of that file could be as follows:

```
# Secrets for authentication using CHAP
# client server secret IP addresses
* mypwd 192.168.60.1
```

Assuming that the serial cable is connected to the first serial port of your PC, and that the receiver's COM1 port is left in its default configuration (115200 baud and no hardware flow control), the client PPP daemon can be started with the following Linux command:

```
pppd /dev/ttyS0 115200 nocrtscts local
```

After a few seconds, the PPP link is established and it is possible to access the receiver at IP address 192.168.60.1.

1.2.4 Via a Web Browser

The receiver can be controlled and configured using a web browser. The hostname or fixed IP address is defined as explained in section 1.2.3.

For example, if your receiver's hostname is mosaic-x5-1234567, simply use the following URL in your preferred web browser:

http://mosaic-x5-1234567

or, for a secure connection:

https://mosaic-x5-1234567

By default, the receiver presents a self-signed certificate during HTTPS handshake, which is susceptible to man-in-the-middle attacks. Preferably, a .pem file containing a trusted certificate and its corresponding private key can be uploaded through the *Communication* > *Web Server/TLS* menu of the web interface.

Most user commands described in section 3.2 can be accessed graphically from the web interface. You can also go to *Admin > Expert Control > Expert Console* to manually type ASCII commands and view replies.

By default, the web interface provides unrestricted read and write access to the receiver. This can be changed, as further explained in section 1.3 of this document.

Note that a lightweight (text only) version of the web interface is available by appending **/lite** to the URL, for example:

http://mosaic-x5-1234567/lite

1.2.5 Connection Descriptors

Receiver connections are identified by their connection descriptor (CD). The different connection descriptors are shown in the table below. The three rightmost columns indicate the direction (input or output or both), and whether the connection can accept user command input.

CD	Description	In	Out	Cmd
COMx	one of the serial ports	•	•	•
USBx	one of the USB-device serial ports	•	•	•
DSK1	the internal disk. See section 1.15		•	
IP1x	one of the TCP/IP connections	•	•	•
NTRx	one of the NTRIP connections. Input in NTRIP client mode (section 1.11), output in NTRIP server mode (section 1.10)	•	•	
IPSx	one of the IP server connections. See section 1.13	•	•	•
IPRx	one of the IP receive connections. See section 1.14	•	•	•

1.3 Manage Users

The receiver maintains a list of known users (username and password) and their access level (Viewer for read-only access or User for full-control access).

To control the receiver over a TCP/IP connection (see section 1.2.3), a user **must** first log in using the **login** command and providing valid credentials⁽¹⁾. This is optional over USB and COM connections: on these connections, anonymous (not logged-in) users have full control by default (this can be changed with **setDefaultAccessLevel**).

Use the **setUserAccessLevel** command to manage existing user accounts and create new ones. For example...

1. To check the list of known users:

```
getUserAccessLevel <CR>
```

The reply to this command looks like:

```
UserAccessLevel, User1, "admin", "R46NCG", User
UserAccessLevel, User2, "", "", Viewer
UserAccessLevel, User3, "", "", Viewer
...
```

2. In the example shown above, only one user is defined: User1 with user name admin. For security reasons, the password shown here (R46NCG) is obfuscated and does not correspond to the actual password. It can be seen that the level of access of the admin user is "User": that particular user has full control of the receiver.

To add a new user "john" with password "abc123" and to give full access to that user, select a free user index, e.g. User2 in the above example, and type:

```
setUserAccessLevel, User2, john, abc123, User <CR>
```

3. To log in as john, type:
 login, john, abc123 <CR>

4. You can define up to eight users. Deleting a user involves entering an empty string ("") as user name and password. For example, to delete the "admin" user from the above list, use:

```
setUserAccessLevel,User1,"","" <CR>
```

The user accounts also apply to FTP, SFTP, rsync and scp accesses. Users having the "User" access right are allowed to delete files from the internal disk, while "Viewer" users can only download files.

1.3.1 Defining the First User over a TCP/IP Connection

When using the receiver for the first time or after a reset to factory default (see **factoryReset**), no user accounts are defined. If a connection is available via USB or a COM port, the first user can be created using the **setUserAccessLevel** command as explained above. However, if the first connection to the receiver is over a TCP/IP port, this procedure does not work, since anonymous users cannot issue commands via TCP/IP.

⁽¹⁾ This was not required in older firmware version, but is now mandatory for enhanced security.

To address this specific case (no user account defined with full-control rights and anonymous control not granted), the **login** command must be invoked with two extra arguments:

login, <UserName>, <Password>, RxAdmin, S3pt3ntr10

This long version of the **login** command tells the receiver to:

- execute the setUserAccessLevel, User1, <UserName>, <Password>, User command, which creates a first user with the selected UserName and Password and with full-control access;
- 2. execute the **exeCopyConfigFile**, **current**, **boot** command to store this first user into the boot configuration file, so that it is known at next boot;
- 3. execute the standard login, <UserName>, <Password> command to log in the newly created user.

Steps 1 and 2 above are only executed if there are no user accounts with full-control rights and if the third and fourth arguments of <code>login</code> strictly match "<code>RxAdmin</code>" and "<code>S3pt3ntr10</code>" respectively. This typically only happens once as the command creates a first user and stores it in the boot configuration. "<code>RxAdmin</code>" and "<code>S3pt3ntr10</code>" are the factory-default username and password.

The receiver will always accept the long version of the <code>login</code> command, but the "RxAdmin" and "S3pt3ntr10" arguments are considered only if there are no user accounts with full-control rights. In all other cases, they are ignored.

1.4 Understand the Output of the Receiver

The receiver outputs proprietary and standardized messages. Each proprietary message begins with a two-character identifier, which identifies the message type.

Proprietary messages	First two characters
ASCII command replies and command error notification	\$R
ASCII transmissions (e.g. periodic output of the status screen), terminated by a prompt. Two sub-types are defined: • \$TD: ASCII display generated by the receiver; • \$TE: event notification (e.g. receiver is shutting down).	\$T
Formatted information blocks (e.g. formal command description)	\$-
SNMP' binary command replies (Septentrio proprietary)	\$&
Proprietary binary data (SBF)	\$@

1.4.1 Proprietary Binary Output (SBF)

The binary messages conform to the SBF definition. The data are arranged in SBF blocks identified by block IDs. All the blocks begin with the SBF identifier \$0. Please refer to section 4 for a description of the SBF format.

The benefit of SBF is completeness. This format should be your first choice if you wish to receive detailed information from the receiver.

The list of supported SBF messages can be found in appendix B

SBF Converter, provided in the RxTools package is an intuitive GUI which allows SBF conversion into e.g. RINEX, KML, GPX or ASCII.

1.4.2 NMEA

The receiver can generate a set of approved NMEA sentences, which conform to the NMEA Standard (version $3.01^{(2)}$ and version $4.10^{(3)}$ are supported). The benefit of the NMEA format is that it is standardized. Many electronic devices and software packages support NMEA. The drawback of NMEA is a relatively low level of detail.

NMEA output is configured with the **setNMEAOutput** command, and the NMEA version (3.01 or 4.10) is selected with the **setNMEAVersion** command.

The list of supported NMEA sentences can be found in appendix C.

NMEA 0183, Standard for Interfacing Marine Electronic Devices, Version 3.01, National Marine Electronics Association, 2002

⁽³⁾ NMEA 0183, Standard for Interfacing Marine Electronic Devices, Version 4.10, National Marine Electronics Association, 2012

1.4.3 RTCM and CMR

The receiver can operate as DGNSS and/or RTK base station and output the corresponding RTCM or CMR messages. The instructions to set the receiver in base station mode can be found in section 1.7.

The list of supported RTCM and CMR messages can be found in appendix D.

1.5 Define an SBF Output Stream

As an example, this section explains how to use the command line interface to configure the receiver to output the MeasEpoch SBF block at 10 Hz, the PVTCartesian SBF block at 1 Hz, and the GPSNav block at its On-Change rate (see section 4.1.8 for more details on the SBF output rate). In this example, we will assume that these blocks must be output through the USB2 connection.

- First make sure that the USB2 connection is configured for SBF output (this is the default). In case this is not so, you should invoke: setDataInOut, USB2, , +SBF <CR>
- 2. Scheduling SBF blocks for output is done by defining so-called "SBF streams". At least 10 SBF streams can be defined by the user. A stream consists of a set of SBF blocks that need to be output at a given rate through a given connection. By default, all streams are empty, and no SBF blocks are output. For our example, we will need to use two streams. Defining these SBF streams involves the setSBFOutput command: setSBFOutput, Stream1, USB2, MeasEpoch+GPSNav, msec100 <CR> setSBFOutput, Stream2, USB2, PVTCartesian, sec1 <CR> Note that the rate specified with the setSBFOutput command (msec100 or sec1 above) only applies to the blocks that support a flexible output rate (see appendix B). The GPSNav block does not support flexible rate: it is always output at its "On-Change" rate regardless of the stream rate. For this reason, in the above example, we could equally have enabled GPSNav in Stream2.
- 3. To stop outputting SBF on a given connection, you can either redefine or empty the corresponding streams:

```
setSBFOutput, Stream1, USB2, none <CR>
setSBFOutput, Stream2, USB2, none <CR>
A second possibility is to disable all SBF messages on that connection:
setDataInOut, USB2, , -SBF <CR>
```

Note that the **exeSBFOnce** command can be used to output a set of blocks once, instead of at regular interval. This is typically used to output all currently available satellite ephemerides at once. For example, the following command instructs the receiver to output all known GPS, GLONASS, Galileo and BeiDou ephemerides over USB2:

```
exeSBFOnce, USB2, GPS+GLO+GAL+BDS <CR>
```

This is a one-time action: the requested blocks are inserted in the stream, and then the normal flow of blocks as defined with **setSBFOutput** resumes. When logging the SBF stream for post-processing, it is a good practice to request all satellite ephemerides with the **exeSBFOnce** command when starting a new log file. Make sure however not to request measurement or PVT blocks with **exeSBFOnce** when these blocks are also enabled with **setSBFOutput** as it could cause the same epoch to be duplicated in the log file. Some post-processing tools may not work properly when the same epoch is repeated twice.

1.6 Save the Configuration in Non-Volatile Memory

The receiver configuration includes all the user-selectable parameters, such as the elevation mask, the PVT mode, the COM port settings,...

The configuration is changed through user commands. The current configuration can be checked with the **lstConfigFile** command:

lstConfigFile, Current <CR>

Most user commands lose their effect after a reset or a power-cycle unless they are explicitly copied into the boot configuration file using:

exeCopyConfigFile,Current,Boot <CR>

Exceptions are the so-called permanent commands: those commands generally relate to the TCP/IP configuration and they are automatically stored in the boot configuration file without needing to call **exeCopyConfigFile**. They are prepended with a "#" symbol in the reply to the **lstConfigFile** command.

1.7 Configure the Receiver in DGNSS/RTK-**Base Mode**

This section is only applicable to receivers having the DGNSSBase and/or the RTKBase capability (see section 1.1).

The receiver can generate and output DGNSS and/or RTK corrections in the RTCM or CMR format. The list of supported messages can be found in appendix D.

1.7.1 **Static Base Station Mode**

To configure the receiver in static base station mode, the following has to be done:

1. For accurate and repetitive absolute positioning, you must provide the accurate coordinates of the antenna reference point (ARP). The ARP usually corresponds to the center of the bottom of the antenna (see also section 2.5). For example, assuming the WGS84 position of the ARP is 50.5°N, 4°E and its altitude above the WGS84 ellipsoid is 100m, use:

```
setStaticPosGeodetic, Geodetic1, 50.5, 4, 100 <CR>
setPVTMode,Static,,Geodetic1 <CR>
```

If you are only interested in accurate determination of the base-rover baseline, with the absolute position of the rover being of lesser importance, accurate positioning of the base station is not required, and you may simply let the receiver determine its fixed position autonomously ("auto-base" mode), by typing:

```
setPVTMode, Static, , auto <CR>
```

2. For RTCM 3.x, the antenna information in message types 1007, 1008 and 1033 can be specified using the setAntennaOffset command, with the serial number as sixth argument, and the antenna type (called "antenna descriptor" in RTCM) as fifth argument (see also section 2.5). For instance:

```
setAntennaOffset, Main, , , , "AT2775-54SW", "5684" <CR>
```

3. Use the **setxxInterval** command to specify the message interval (replace xx by the format name). For instance, to change the interval at which RTCM 3.x message type 1033 is generated to 10 seconds, type:

```
setRTCMv3Interval,RTCM1033,10 <CR>
```

4. Use the **setxxFormatting** command to specify the base station ID. If you are setting up multiple base stations, make sure to select a unique ID for each of them. For instance:

```
setRTCMv3Formatting, 496 <CR>
```

5. By default, the receiver is configured to output all RTCM and CMR messages necessary for DGNSS and RTK operation. If necessary, the set of output messages can be specified with the setxxOutput command. For instance, to output RTCM3.x messages 1006, 1033 and 1074 on COM2, use:

```
setRTCMv3Output, COM2, RTCM1006+RTCM1033+RTCM1074 <CR>
```

If you are using the RTCM3.x MSM messages (see appendix D), you can use the **setRTCMv3Formatting** command to configure the signal types that need to be encoded in MSM.

- 6. The RTCM stream can be output through any output connection listed in section 1.2.5. For instance, to enable RTCM 3.x output through COM2, use:
 - setDataInOut,COM2,,RTCMv3 <CR>
- 7. When sending differential corrections over a serial port, do not forget to specify the baud rate. For instance if the differential correction stream needs to be output on COM2 at 9600 baud, use:
 - setCOMSettings,COM2,baud9600 <CR>

To stop transmitting RTCM messages, enter the following command: setDataInOut, COM2, , none <CR>

Note that, even in static mode, the receiver computes a PVT solution to estimate the clock bias.

1.7.2 RTK Moving Base Station Mode

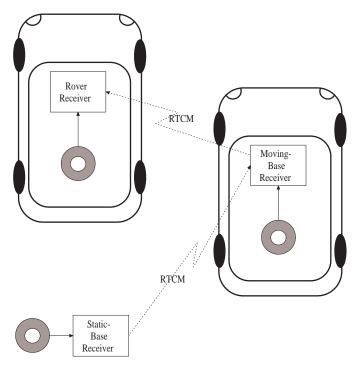

Figure 1-3: Example of a RTK moving-base configuration where the moving base receives RTCM corrections from a static base and transmits RTCM corrections to the rover.

To configure the receiver in RTK moving base, follow the steps below:

1. The PVT engine must be set in one of the rover modes (standalone, DGNSS, SBAS, RTK). The type of the PVT mode at the moving base station will determine the absolute

position accuracy of the RTK rover receiver. On the other hand, the accuracy of the relative position of the rover with respect to the moving base is not influenced by the PVT mode at the moving base station.

For instance, to let the moving base station compute a simple standalone PVT, use the following:

setPVTMode,Rover,StandAlone <CR>

If accurate absolute and relative positioning of the rover is required, the moving base can operate in RTK-rover positioning mode and receive RTCM or CMR corrections from a static base station, as illustrated in Figure 1-3. Refer to section 1.8 to configure the moving-base receiver in RTK-rover mode.

- 2. From now on, follow the same procedure as for a static base station, starting at step 2 of section 1.7.1 and taking into account the following recommendations:
 - RTCM v2.x and CMR are not recommended for moving-base applications, always use RTCM v3.x in the link between the moving base and the rover.
 - To decrease the effect of extrapolation errors, use a short RTCM or CMR message interval (see the commands **setRTCMv3Interval** and **setCMRv2Interval**). In most cases, it is safe to set the interval to its minimum value of 0.1 seconds. If the RTCM or CMR messages are sent through a COM connection, make sure that the baud rate is sufficient to support the high rate. A value of 115200baud is typical.
 - In moving base, it is recommended to send the base position and observables at the same rate.

See also section 2.4.3.3 for more details on moving-base operation.

1.8 Configure the Receiver in DGNSS/RTK-**Rover Mode**

This section is only applicable to receivers having the DGNSSRover and/or the RTKRover capability (see section 1.1).

The receiver computes a DGNSS and/or an RTK solution when it receives the relevant differential correction messages on one of its connections. The list of supported differential correction messages can be found in appendix D.

To configure the receiver in DGNSS/RTK-rover mode, the following has to be done:

1. Make sure that at least one of the receiver connections is receiving differential corrections. Any input connection listed in section 1.2.5 is suitable. When using a serial connection, make sure to configure the baud rate to match the baud rate of the incoming RTCM stream. For instance if the incoming RTCM stream is received through COM2 at a baud rate of 9600 baud, use:

setCOMSettings, COM2, baud9600 <CR>

2. By default, the receiver assumes that the base station is static. If it is moving, enter the following command:

setDiffCorrUsage, , , , , on <CR> In DGNSS-rover mode, the base station must be static. Moving base stations are only supported in RTK-rover mode.

3. The receiver automatically detects the format of the differential corrections and switches between standalone, DGNSS or RTK modes according to the type of corrections it receives, provided these modes are enabled with the setPVTMode command (all modes are enabled by default).

Refer to sections 2.4.2 and 2.4.3 for further details on the DGNSS and RTK positioning mode.

Determine a GNSS-Based Attitude from a Moving Base

This section is only applicable to receivers having the MovingBase capability (see section 1.1).

The heading and pitch of a vehicle can be derived from the orientation of the baseline between a base and a rover antenna when both antennas are attached to the vehicle. The base antenna is connected to a first receiver configured as RTK moving base station. The rover antenna is connected to a second receiver configured as RTK rover and accepting the RTCM stream from the first receiver. This is illustrated in Figure 1-4.

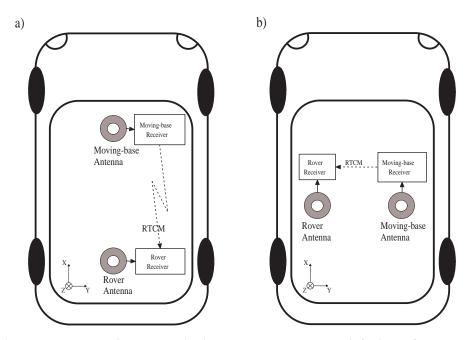

Figure 1-4: Moving-base attitude determination setup. a) default configuration. b) example of non-default configuration.

To enable moving-base attitude determination, follow the following procedure:

- 1. Attach two antennas to your vehicle. The default antenna configuration is as depicted in Figure 1-4 a). It consists in placing the antennas aligned with the longitudinal axis of the vehicle. If such configuration is not possible, you will have to provide additional information to the receiver, as explained below. For best accuracy, try to maximize the distance between the antennas, and avoid significant height difference between them.
- 2. Connect one of the antennas (preferably the one at the front of the vehicle) to the receiver that will serve as moving base. Connect the other to the receiver that will serve as rover. That latter receiver is the one where the heading and pitch will be computed.
- 3. Configure the moving-base receiver to send RTCM 3.x corrections to the rover. The procedure to do so is explained in section 1.7.2.
- 4. Configure the rover receiver to accept the RTCM corrections from the moving base, by following the steps in section 1.8.

- 5. By default, the attitude angles are computed assuming that the two antennas are aligned with the longitudinal axis of the vehicle, and that the moving-base antenna is in front of the rover antenna (see Figure 1-4 a)). If you cannot place the antennas in such configuration, the reported attitude angles will be biased. There are two ways to remove these biases:
 - (a) The biases can be removed by telling the receiver where the moving-base antenna is located in the vehicle reference frame (see appendix A). This is done by specifying the coordinates of the baseline between the rover antenna reference point (ARP) and the moving-base ARP in the X, Y and Z directions. For example, in the configuration b) of Figure 1-4, assuming that the distance between the antenna ARPs is 1 meter, you would issue (on the rover receiver):

setAntennaLocation,Base,manual,0,1,0 <CR>

- (b) Another way to remove the biases is to provide them to the receiver. For example, if the heading and pitch angles reported by the receiver have an offset of respectively 10 and 12 degrees with respect to their expected value, you can have the receiver compensate for that offset by using the following command: setAttitudeOffset, 10, 12 <CR>
- 6. Specify that the attitude has to be computed in moving-base mode by issuing the following command in the rover receiver:

setGNSSAttitude, MovingBase <CR>

The attitude angles are available from the rover receiver in the AttEuler SBF block or in the HDT and HRP NMEA sentences.

1.10 Configure the Receiver in NTRIP Server Mode

In the example below, we show how to configure the receiver to send RTCM 3.x corrections to an NTRIP caster using the following parameters:

- NTRIP caster hostname: ntrip.example.com
- NTRIP caster port: 2101
- User name/password for basic authentication: USER / PASSWD
- Mount Point: LEUV1
- TLS: enabled and the caster is trusted by a public certification authority
- 1. Configure one of the NTRIP connections (see section 1.2.5) in server mode for sending data to the NTRIP caster. Here, we assume that the first NTRIP connection (NTR1) is free and can be used for that purpose:
 - setNTRIPSettings,NTR1,Server,ntrip.example.com,2101,USER,PASSWD,LEUV1
 <CR>
- 2. To enable TLS for NTR1, use:
 setNtripTlsSettings, NTR1, on, "" <CR>
- 3. By default, for RTCM 3.x, the receiver is configured to send message types 1004, 1006, 1012 ans 1033 at an interval of one second. This can be changed by using the **setRTCMv3Output** and **setRTCMv3Interval** commands. For instance, to change the interval of RTCM1033 to 10 seconds, use: **setRTCMv3Interval**, RTCM1033, 10 <CR>
- 4. Enable the output of RTCM 3.x corrections on the NTR1 connection: setDataInOut, NTR1, , RTCMv3 <CR>
- 5. Closing the NTRIP connection is done with the following command: setNTRIPSettings, NTR1, off <CR>

See also section 1.7 for more information on configuring the receiver as a base station.

The NTRIP server can also send data to the built-in caster, by specifying "localhost" as host-name. Refer to section 1.12 for details.

1.11 Configure the Receiver in NTRIP Client Mode

In this section, we show how to configure the receiver to receive and use RTK corrections from an NTRIP caster. In the example below, the NTRIP caster and Mount Point details are as follows:

- NTRIP caster hostname: ntrip.example.com
- NTRIP caster port: 2101
- User name/password for basic authentication: USER / PASSWD
- Mount Point: LEUV1
- TLS: enabled and the caster is trusted by a public certification authority
- 1. Configure one of the NTRIP connections (see section 1.2.5) for communication with the NTRIP caster in client mode. Here, we assume that the first NTRIP connection (NTR1) is free and can be used for that purpose:

setNTRIPSettings,NTR1,Client,ntrip.example.com,2101,USER,PASSWD,LEUV1
<CR>

2. To enable TLS for NTR1, use:
 setNtripTlsSettings, NTR1, on, "" <CR>

- 3. The receiver will automatically receive and decode the RTK corrections from the NTRIP caster and switch to RTK positioning mode, unless RTK is disabled with the **setPVTMode** command.
- 4. Closing the NTRIP connection is done with the following command: setNTRIPSettings, NTR1, off <CR>

The status of the NTRIP client connection is reported in the NTRIP client Status SBF block.

1.12 Use the Built-In NTRIP Caster

The receiver contains an NTRIP caster, which is able to broadcast local data streams originating from the receiver itself, or streams from any remote NTRIP server. The hostname or IP address of the built-in caster is as defined in section 1.2.3.

1.12.1 Broadcasting Local Streams

This section explains how to use the built-in NTRIP caster to broadcast a local stream generated by the receiver's own NTRIP server.

- 1. Define the mount point you want to use for streaming the data. For example, the following command enables the first mount point, gives it the name "MyMP", and specify that this mount point only accepts local streams:
 - setNtripCasterMountPoints, MP1, on, MyMP, No <CR>
- 2. Define the data format. For example, if the mount point defined above is meant to stream RTCM v3.x corrections, use the following command:
 - setNtripCasterMPFormat, MP1, RTCMv3 <CR>
- 3. Define the NTRIP client accounts. For example, the command below enables an NTRIP client connecting as user "u1" and with password "p1" to receive data from the first mount point:
 - setNtripCasterUsers, User1, u1, p1, MP1 <CR>
- 4. Configure the local NTRIP server to send data to the mount point, as explained in section 1.10. To have the local NTRIP server send data to the built-in caster, the hostname has to be set to "localhost". For example, to send data to the mount point "MyMP" of the caster, use:
 - setNTRIPSettings,NTR1,Server,localhost,,,,MyMP <CR>
- 5. Enable the built-in NTRIP caster: setNtripCasterSettings, on <CR>

1.12.2 Broadcasting Remote Streams

To configure the caster to broadcast a stream originating from a remote NTRIP server, follow the following steps.

- 1. Define the mount point. For example, the following command enables the first mount point, gives it the name "MyMP", and specifies the credentials that the remote NTRIP server will need to use in order to feed data to this mount point ("FeedUser" and "FeedPwd"):
 - setNtripCasterMountPoints, MP1, on, MyMP, Yes, FeedUser,
 FeedPwd <CR>
- 2. Define the stream data format. For example, if the mount point defined above is meant to stream RTCM v3.x corrections, use the following command:

setNtripCasterMPFormat, MP1, RTCMv3 <CR>

- 3. Define the NTRIP client accounts. Up to five client accounts can be configured. For example, the command below enables an NTRIP client connecting as user "u1" and with password "p1" to receive data from the first mount point:
 - setNtripCasterUsers, User1, u1, p1, MP1 <CR>
- 4. Enable the built-in NTRIP caster:
 setNtripCasterSettings, on <CR>

From now on, the NTRIP caster is ready to receive a data stream from a remote NTRIP server and to distribute it to NTRIP clients.

1.13 Configure an IP Server Port

In this example, we show how to configure the receiver such that any client connecting to TCP/IP port 28785 will receive the NMEA GGA message at a 1-second interval.

- Configure one of the IP server connections (see section 1.2.5) to listen to port 28785.
 Here, we assume that the first IP server connection (IPS1) is free:
 setIPServerSettings, IPS1, 28785, TCP <CR>
- 2. Output the GGA NMEA message to the IPS1 connection, at a 1-Hz rate: setNMEAOutput, Stream1, IPS1, GGA, sec1 <CR>
- 3. Make sure that NMEA output is enabled on the IPS1 connection. It is enabled by default, but in case your receiver is not in its default configuration, you should invoke: setDataInOut, IPS1, ,+NMEA <CR>

A way to check the IP server functionality is to enter the URL http://mosaic-x5-xxxxxxx:28785 in your preferred web browser (replace mosaic-x5-xxxxxxx by the hostname of your particular receiver). You should see the NMEA GGA message coming every second.

Note that up to eight clients can concurrently connect to the same IP server port.

The example above showed how to set up a TCP server. It is also possible to configure the receiver in UDP server mode. For example, to broadcast the GGA message to any UDP client listening to its port 28785, the command in step 1. above must be replaced by: setIPServerSettings, IPS1, 28785, UDP, 255.255.255.255 <CR>

Conversely, the receiver can be configured to automatically receive data from an IP server. This is explained in section 1.14.

1.14 Configure an IP Receive Port

The receiver can be configured to automatically receive data (typically differential corrections) from an IP server. In this example, we show how to connect to an IP server having the hostname MyServer and using port 28786.

- Configure one of the IP receive connections (see section 1.2.5) to listen to port 28786 of MyServer. Here, we assume that the first IP receive connection (IPR1) is free: setIPReceiveSettings, IPR1, 28786, TCP2Way, MyServer <CR>
- 2. If the data stream from the IP server contains differential corrections in CMR or RTCM format, the receiver will automatically decode them and use them in the PVT processing.
- 3. To close the connection, enter the following command: setIPReceiveSettings, IPR1, 0 <CR>

The TCP connection initiated by the receiver is bidirectional. Once the connection is established, the receiver accepts input data from the server (as shown above), but it can also send data to the server, or process user commands from the server.

The example showed how to set up a TCP connection with the server. The receiver can also listen to incoming UDP messages. In that case, the connection is unidirectional and the server address or hostname must not be specified. For example, to listen to UDP messages on port 28786, use the command:

setIPReceiveSettings, IPR1, 28786, UDP <CR>

1.15 Log SBF or NMEA

This section is only applicable to receivers having the InternalLogging capability (see section 1.1).

The connection descriptor (see section 1.2.5) associated to the internal disk is "DSK1". Enabling SBF or NMEA logging on the internal disk involves the following steps:

1. By default, the receiver logs SBF blocks into a file named "log.sbf" and NMEA sentences into a file named "log.nma". You can specify any other fixed or autoincrementing file name, or you can select the IGS/RINEX naming convention, where the file name automatically changes every fifteen minutes, hour, six hours or day. For instance, to let the receiver create daily files, use:

setFileNaming,DSK1,IGS24H <CR>

If the file name you selected already exists, the receiver will append new data at the end of the existing file.

2. Use the command **setSBFOutput** to define which SBF blocks need to be logged (for NMEA, use setNMEAOutput instead), and at which interval (see also section 1.5). For instance, to log all SBF blocks necessary to build RINEX files, with the measurements and positions being output at a 10-s interval, use:

setSBFOutput, Stream1, DSK1, rinex, sec10 <CR>

3. Start the logging by enabling SBF and NMEA output to the DSK1 connection (it is enabled by default):

setDataInOut,DSK1, ,+SBF+NMEA <CR>

4. Once the logging session is finished, stop the logging by invoking: setDataInOut,DSK1,,-SBF-NMEA <CR>

Refer to section 1.17 to learn how to download the logged files.

1.16 Log RINEX Files

This section is only applicable to receivers having the InternalLogging capability (see section 1.1).

The receiver can log RINEX observation and navigation files on its internal disk. RINEX v2.11 and 3.04 are supported.

Internal RINEX logging is typically configured as follows:

- 1. The information needed to generate the RINEX file names is taken from the setMarkerParameters command. For example, to set the station name designator (the first four characters of the RINEX file names) to "LEUV", use:
 - setMarkerParameters, , , , LEUV <CR>
- 2. The fields in the RINEX observation header are specified with the setMarkerParameters, setObserverParameters and setAntennaOffset commands. For example, if the observer's name is "MyName" and its agency is "MyAgency", use the command:
 - setObserverParameters, MyName, MyAgency <CR>
- 3. For static installations, the reference marker position to put in the "APPROX POSITION XYZ" header line can be defined with the RefPos argument of setPVTMode, with the marker-to-ARP offset being defined with setAntennaOffset. For example, assuming the WGS84 position of the ARP is 50.5°N, 4°E and its altitude above the WGS84 ellipsoid is 100m, and the ARP is 1.5 meters above the marker, use:

```
setStaticPosGeodetic, Geodetic1, 50.5, 4, 100 <CR>
setPVTMode, , ,Geodetic1 <CR>
setAntennaOffset,Main,0,0,1.5 <CR>
```

- 4. Use the **setRINEXLogging** command to specify the file duration (fifteen minutes, one hour, six hours or one day), the observation interval and the type of observables to include in the RINEX file. For example, to generate daily RINEX files with the observation file containing only GPS L1CA data at a 30-s interval, use:
 - setRINEXLogging, DSK1, Hour24, sec30, GPSL1CA <CR> In this command, DSK1 refers to the internal disk.
- 5. The command **setDiskFullAction** specifies what to do when the internal disk becomes full. For example, you could ask the receiver to automatically delete the oldest file to free up disk space. To do so, use:
 - setDiskFullAction, DeleteOldest <CR>

Instead of logging RINEX files inside the receiver, you can also convert an SBF file to RINEX using the sbf2rin program or the SBFConverter graphical tool.

1.17 Download Log Files from the Receiver

This section is only applicable to receivers having the InternalLogging capability (see section 1.1).

There are different ways to download or delete files from the internal disk:

1. Using RxControl. Select Logging > Download Internal Files to download files to your computer, and Logging > Remove Internal File to remove a file from the internal disk.

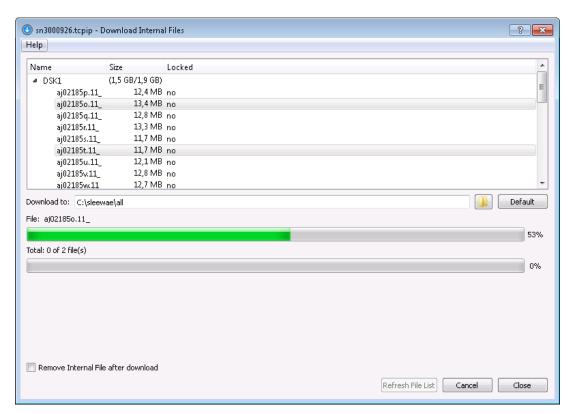

Figure 1-5: Download Internal Files from RxControl.

2. Using FTP or SFTP if they have been enabled with the **setIPServices** command. The hostname or fixed IP address is defined as explained in section 1.2.3. User authentication for SFTP access can be done by entering a password or using an ssh public key, as defined with the **setUserAccessLevel** command.

By default, anonymous FTP users are not allowed. This can be changed with the setDefaultAccessLevel command.

3. Using rsync or scp if they have been enabled with the **setIPServices** command. The hostname or IP address is the same as for (S)FTP, see above.

For example, to download the contents of the log.sbf file of the internal disk (DSK1) to the current folder on your local computer, you could invoke rsync as follows:

rsync -r username@mosaic-x5-1234567:DSK1/SSN/GRB0051/log.sbf .

defined should be a valid username where username setUserAccessLevel command, or "anonymous" if anonymous file transfer

has been enabled with the **setDefaultAccessLevel** command.

If the same command is issued again at a later stage, rsync will only transfer the deltas with respect to the files already present on the local machine, significantly reducing the number of bytes sent compared to retransmitting the entire files.

User authentication can be done by entering a password, or using an ssh public key, as defined with the **setUserAccessLevel** command.

- 4. Using the web interface (select the *Logging* tab).
- 5. Using a standard file browser and accessing the receiver as a removable drive (USB mass-storage device). This requires the USB cable to be connected to your computer, and the internal disk to be unmounted by the receiver so that it can be accessed by your computer's operating system. This can be done automatically upon connecting the USB cable, as configured with the **setUMSDOnConnect** command.

1.18 FTP Push Log files

This section is only applicable to receivers having the InternalLogging capability (see section 1.1).

It is possible to configure the receiver to automatically send internally-logged files to a remote FTP server (FTP Push). This is done with the setFTPPushSBF and setFTPPushRINEX commands respectively.

For example, to automatically FTP RINEX files to the directory mydata/rin/YYDDD (with YY and DDD the year and day-of-year) on the remote server myftp.com, with username myname and password mypwd, you would enter the following command:

setFTPPushRINEX, myftp.com, mydata/rin/%y%j, myname, mypwd <CR>

To FTP push SBF files to the same location, you would use: setFTPPushSBF, myftp.com, mydata/rin/%y%j, myname, mypwd <CR>

FTP push will create the folder on the remote server if it does not exist yet.

1.19 Communicate with External Equipment

The receiver can send periodical queries to external equipment (such as a meteo sensor) connected to one of its serial ports, and log the replies from that sensor. In the following example, we show how to retrieve meteo data every 10 seconds from a meteo sensor connected to the receiver's COM2 port.

1. Tell the receiver which command to use to query the external sensor, and the interval at which this command must be sent to the sensor. For instance, for a MET3/MET4-compatible sensor, the command *0100P9<CR><LF> queries the meteo data. Assuming you want to get meteo data at a 10-second interval, enter the following command:

setPeriodicEcho, COM2, A:*0100P9%%CR%%LF, sec10 <CR>

2. Enable unformatted ASCII input on COM2 (to receive the replies from the meteo sensor):

setDataInOut,COM2,ASCIIIn <CR>

The replies from the meteo sensor (containing the temperature, pressure and humidity) are available in the ASCIIIn SBF block.

You can convert an SBF file containing ASCIIIn SBF blocks to RINEX using the sbf2rin program or the SBFConverter graphical tool. To be able to generate a RINEX file, the output of the meteo sensor must be formatted according to the NMEA XDR sentence.

1.20 Generate a "Pulse Per Second" Signal

The receiver is able to generate an x-pulse-per-second (xPPS) signal aligned with a selected GNSS system time, with UTC or with the internal receiver time.

The **setPPSParameters** command is used to set the xPPS parameters (rate, polarity, time system, ...). For instance, to synchronize the xPPS pulses with UTC and have one pulse every ten seconds, use:

setPPSParameters, sec10, , , UTC <CR>

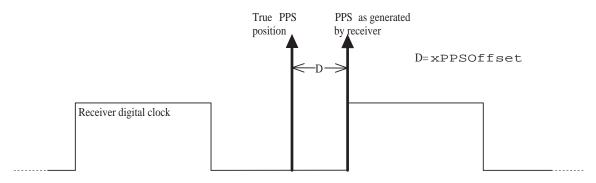

Figure 1-6: xPPS output granularity.

Although the position of the PPS pulse is computed accurately by the receiver, the actual pulse is generated at the nearest "tick" of the internal receiver digital clock, as illustrated in the figure above. This leaves an offset (noted "D" in the figure) between the true xPPS pulse and the one actually generated by the receiver. This offset can reach a few nanoseconds. It is available in real-time in the xPPSOffset SBF block.

To be able to align its xPPS output with the GNSS system time, the receiver needs a fresh estimate of the GNSS time from its PVT solution. If the last PVT solution is older than a prescribed timeout (set by the **setPPSParameters** command), no PPS pulse is generated. In addition, to align its PPS with UTC, the receiver needs to have received the UTC offset parameters from the satellite navigation messages. If these parameters are not available and the user has requested to align the xPPS with UTC, no xPPS pulse is generated.

Time Tag External Events

This section is only applicable to receivers having the TimedEvent capability (see section 1.1).

The receiver can accurately time-tag electrical level transitions on its EventX inputs.

By default, the receiver reacts on low-to-high transitions. You can use the **setEventParameters** command to react on falling edges instead: setEventParameters, EventA, High2Low <CR>

Upon detection of a transition, the receiver can output the time and/or the position at the instant of the event (see for example the ExtEvent SBF block).

The following constraints must be observed to ensure proper event detection:

- There must be no more than 20 events in any interval of 100 milliseconds, all event pins
- The minimum time between two events on the same EventX input must be at least 5ms.

Missed events are flagged by the MISSEDEVENT bit in the ReceiverStatus SBF block.

1.22 Monitor the RF Spectrum

You can monitor the RF spectrum using the spectral analyzer in RxControl (go to the *View* > *Spectral View* menu) or in the web interface (go to the *GNSS* > *Spectrum* menu). This allows to detect the presence of interferences in the GNSS bands.

In the example shown below, a narrowband interference at 1180 MHz is clearly visible.

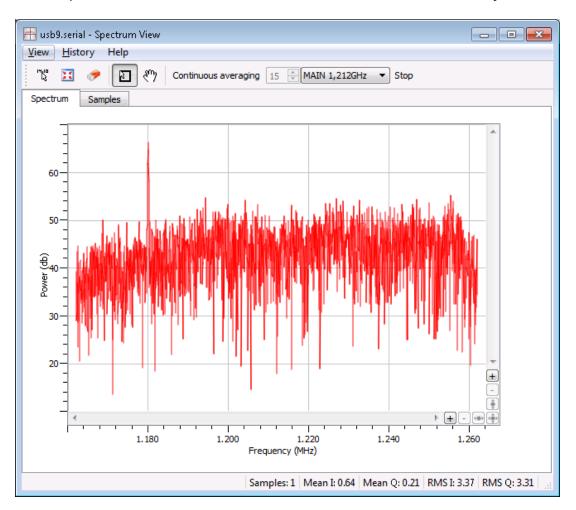

Figure 1-7: Spectral Analyser functionality of RxControl.

The spectrum is computed from baseband samples taken at the output of the receiver's analog to digital converters. These samples are available to the users in the BBSamples SBF block.

1.23 Detect Spoofing Attacks

The receiver continuously checks various parameters to ensure the integrity and authenticity of the received GNSS signals. It also performs Navigation Message Authentication (NMA) using Galileo OSNMA. The outcome of those checks is available in the Flags field of the RFStatus SBF block, and is also reported as an icon in the header of each page of the web interface. For instance, the plot below shows a red "Spoofing!" icon, indicating spoofing suspicion.

The following guidelines are suggested to maximize the probability of detecting a spoofing attack:

- Make sure that the antenna net gain (antenna LNA gain minus cable loss) is within the
 operating range of the receiver, as specified in the Hardware Manual. In particular, the
 automatic gain control (AGC) gain should be lower than 50dB for all frequency bands.
 The AGC gain can be checked in RxControl (View > AGC Table) or in the web interface
 (GNSS > Spectrum > Status).
- Make sure that the AGC is in automatic mode. This is the default, but in case the
 receiver is not in its default configuration, you can enable auto-AGC mode with:
 setAGCMode, all, auto <CR>
- Numerous spoofing detectors are based on cross-frequency and cross-constellation consistency checks. For optimal detection, it is therefore preferred to enable the tracking of all GNSS satellites and signals, at the cost of a slight increase of the CPU load:

```
setSignalTracking,all <CR>
setSatelliteTracking,all <CR>
```

• Additional checks are enabled for static receivers. If the receiver is known to be static, it is a good idea to configure it explicitly in static mode:

```
setPVTMode, Static <CR>
```

• If the receiver is connected to the Internet, it is recommended to enable its built-in NTP client to get access to an independent time source. For example, to enable time retrieval from the default NTP server, use:

```
setNTPClient, on, default
```

Enable Galileo OSNMA following the instructions in section 1.24.

1.24 Use Galileo OSNMA

With the Open Service Navigation Message Authentication (OSNMA) feature, Galileo satellites allow to verify the authenticity of navigation messages received from GNSS satellites, offering a powerful means to detect and counter spoofing attacks. In Septentrio receivers, OSNMA is used to discard untrusted satellites from the measurements and/or PVT engine.

For the measurements, two OSNMA authentication levels are available: *off* where OSNMA authentication is ignored, *loose* where measurements are provided for satellites passing the authentication test or if their authentication status is unknown. In that mode, measurements from satellites failing OSNMA authentication are discarded from all internal processing (including the PVT engine), output streams and log files.

For the PVT, three OSNMA authentication levels are supported: *off* where OSNMA authentication is ignored, *loose* where satellites are included in the PVT processing if they are successfully authenticated or if their authentication status is unknown, and *strict* where only successfully-authenticated satellites are included. In *strict* mode, the number of satellites available to the PVT may be limited as OSNMA does not authenticate all visible satellites (e.g. only Galileo satellites depending on the OSNMA service status).

After enabling OSNMA at measurement and/or PVT level, it typically takes a few tens of seconds to a few minutes to authenticate messages. In *strict* mode, no PVT is computed during that time.

OSNMA is configured as follows:

- Use the setGalOSNMAUsage command to enable OSNMA authentication at PVT and/or measurement level. For example, to discard measurements from non-authentic satellites from the measurements and the PVT engine, use: setGalOSNMAUsage, loose, loose <CR>
- 2. In strict PVT mode, OSNMA authentication requires time information from an external non-GNSS source. In loose mode, this is optional but recommended for enhanced security. The user can enter the current time with the exeSetTime command or the receiver can retrieve it automatically from an NTP time server, as configured with the setNTPClient command. For example, to enable time retrieval from the default NTP server, use:

```
setNTPClient, on, default <CR>
```

The receiver has been optimized for use with live Galileo signals. Necessary keys are embedded into the software. For example the Galileo Merkle Tree root key, needed to enable over-the-air reception of public keys, is known by the receiver, obviating the need for the user to provide it.

Refer to section 2.6 for further details.

Upgrade the Receiver

Upgrading the receiver is the process of installing a new GNSS firmware, a new permission file (see section 1.26) or a new antenna calibration file (see section 2.5).

In some cases, upgrading the GNSS firmware can clear the receiver configuration stored in non-volatile memory (see section 1.6). It is therefore advised to recheck the configuration after the upgrade.

Do not switch power off during the upgrade procedure.

Upgrading the receiver over a serial port can be very slow and it is recommended to upgrade. using a faster connection whenever possible (USB or Ethernet).

Septentrio upgrade files have the extension ".suf". There are several ways to upgrade the receiver:

- 1. By double clicking the ".suf" file. This should launch the RxUpgrade program.
- 2. By using the RxControl graphical interface (go to the File menu).
- 3. From the web interface (go to Admin > Upgrade). This requires to log in as a user with the "User" access level (see section 1.3).
- 4. By commanding the receiver to upgrade itself by fetching the upgrade file from a remote FTP server. This is done with the command exeFTPUpgrade.
- 5. By manually downloading upgrade files to the receiver. This upgrade procedure is explained below.

To manually upgrade the receiver, follow this procedure:

- 1. Reset the receiver into upgrade mode by entering the following command: exeResetReceiver, Upgrade, none <CR>
- 2. Wait till the receiver outputs the string: "Ready for SUF download ...". From that moment on, the receiver is waiting for an upgrade file to be downloaded. The file download must start within 200 seconds, otherwise the receiver will restart in normal mode.
- 3. Download the upgrade file to the receiver. Any of the receiver connections can be used. Make sure to send the file in binary mode, i.e. without changing its contents. During the download, the receiver outputs a progress indicator at regular interval.
- 4. At the end of the download, the receiver automatically executes the upgrade instructions and restarts with the new firmware version. You can check the firmware version by entering the following command:

lif, Identification <CR>

Before executing the upgrade instructions, the receiver checks the integrity of the downloaded file. If the file is corrupted, or is not a valid upgrade file, the receiver discards it and restarts in normal mode.

If the download is interrupted for any reason, the receiver will restart in normal mode after a timeout period of 200 seconds.

1.26 Check the Receiver Permissions

The permission file lists which optional features (such as dual-antenna, logging, RTK, ...) are permitted on your receiver, for how long they are permitted and in which region they are permitted.

The permission file is stored in the receiver's non-volatile memory, and can be checked with the command **lstInternalFile**, **Permissions**, or with RxControl by clicking *Help >Receiver Permissions*.

Note that, for a given feature to be enabled in the receiver, it must be permitted and the hardware and firmware version must support it. See also section 1.1.

1.27 Reset to Factory Default

Chapter 2

Operation Details

This chapter describes the key processes implemented in the receiver and explains how they can be configured.

2.1 Channel Allocation and Signal Selection

The receiver automatically allocates satellites to tracking channels up to the limit of the number of channels. It is possible to override this automatic channel allocation by forcing a satellite to a given channel with the **setChannelAllocation** command. Also, a subset of satellites or a whole constellation can be disabled with the **setSatelliteTracking** command.

For each satellite, the receiver tries to track all signal types enabled with the **setSignalTracking** command. For example, if that command enables the GPSL1CA, GPSL2PY and GLOL1CA signals, GPS satellites will be tracked in dual-frequency mode (GPSL1CA and GPSL2PY) and GLONASS satellites will be tracked in single-frequency mode (GLOL1CA only). It is a good practice to only enable those signal types that are needed for your application to avoid wasting tracking channels.

2.2 Generation of Measurements

For each tracked GNSS signal, the receiver generates a "measurement set", mainly consisting of the following observables:

- a pseudorange in meters;
- a carrier phase in cycles;
- a Doppler in Hertz;
- a carrier-to-noise ratio in dB-Hz.

All data in a measurement set, and all measurement sets are taken at the same time, which is referred to as the "measurement epoch". All the measurement sets taken at a given measurement epoch are output in a MeasEpoch SBF block.

Several commands affect the way the receiver produces and outputs measurements:

• To further reduce the code measurement noise, the receiver can be ordered to smooth the pseudorange by the carrier phase. This technique, sometimes referred to as a

- "Hatch filtering", allows to reduce the pseudorange noise and multipath. It is controlled by the **setSmoothingInterval** command and is disabled by default.
- The **setMultipathMitigation** command can be used to enable or disable the mitigation of multipath errors on the pseudorange and carrier phase measurements. It is enabled by default.

For advanced applications or in-depth signal analysis, the MeasExtra SBF block contains various additional data complementing the MeasEpoch SBF block. Among other things, this block reports the multipath correction applied to the pseudorange (allowing one to recompute the original pseudorange), and the observable variances.

2.2.1 Pilot vs. Data Component

Most modern GNSS signals consist of two components: a so-called pilot component and a data component. For such signals, the measurements are based on the pilot component for optimal performance. In particular, the reported C/N_o value is that of the pilot component only.

For all signals having a pilot and a data component, the table below indicates which component is tracked by Septentrio receivers. Note that your particular receiver model may not support all of these signals.

Signal	Signal component being used for measurement generation
GPS/QZSS L1C	L1C-P
GPS/QZSS L2C	L2C-L
GPS/QZSS L5	L5-Q
GLONASS L3	L3-Q
Galileo E1	E1-C
Galileo E6	E6-C or E6-B if E6-C is encrypted on at least one satellite in view (the same signal is used for all satellites)
Galileo E5a	E5a-Q
Galileo E5b	E5b-Q
Galileo E5AltBOC	E5AltBOC-Q
BeiDou B1C	B1C_pilot
BeiDou B2a	B2a_pilot
BeiDou B2b	B2b_I

See also the corresponding RINEX observation code in section 4.1.10.

2.3 Time Management

The receiver time is kept in two counters: the time-of-week counter in integer milliseconds (TOW) and the week number counter (WNc). TOW and WNc follow the GPS convention, i.e.

WNc counts the number of complete weeks elapsed since January 6, 1980, and there are no leap seconds. The TOW and WNc counters are reported in all SBF blocks.

The synchronization of TOW and WNc involves the following steps:

- Upon powering up the receiver, TOW and WNc are assumed unknown, and set to a "Do-Not-Use value" in the SBF blocks.
- The transmission time-of-week and week number are decoded from the GNSS satellites (all constellations considered, not only GPS):
 - As soon as the first time-of-week is decoded, the TOW counter is initialized to within 20 ms of GPS time and starts counting. This is also the time when the receiver starts generating GNSS measurements (pseudoranges and carrier phases).
 - As soon as the week number is decoded (which can be either simultaneously with the time-of-week, or several seconds later), the WNc counter is set and starts counting.
- After the first position and time fix has been computed (for which measurements from at least 4 satellites are required), TOW is set to within X milliseconds of GPS time. This is done by introducing a jump of an integer number of milliseconds in the TOW counter. X is the maximal allowed offset between the receiver time and GPS time, and is set by the setClockSyncThreshold command (by default, X=0.5ms). This initial clock synchronization leads to a simultaneous jump in all the pseudorange and carrier phase measurements.

The synchronization level is given by three status bits (TOWSET, WNSET and FINETIME) available in both the ReceiverTime SBF block and the ReceiverStatus SBF block. Once the FINETIME bit is set, it remains set until the next reset of the receiver.

The receiver clock can be configured in free-running mode, or in steered mode using the command **setClockSyncThreshold**.

2.3.1 Free-Running Clock

In free-running mode, the receiver time slowly drifts with respect to GNSS time. The receiver continuously monitors this time offset: this is the clock bias term computed in the PVT solution, as provided in the RxClkBias field of the PVTCartesian and PVTGeodetic SBF blocks. A clock jump of an integer number of milliseconds is imposed on the receiver clock each time the clock bias exceeds X milliseconds by an absolute value (X is set by **setClockSyncThreshold**). This typically results in a saw-tooth profile similar to that shown in Figure 2-1. In this example, X=0.5ms and each time the clock bias becomes greater than 0.5ms, a jump of 1ms is applied.

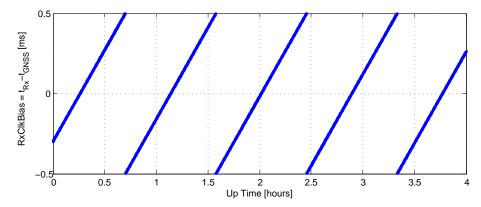

Figure 2-1: Example of the evolution of the receiver time offset with respect to the GNSS time in free-running mode.

Note that the clock bias is computed with respect to a particular GNSS time system (GPS, Galileo, BeiDou, ...) as set with the **setTimingSystem** command. The time offset between those systems is at the level of a couple of nanoseconds only, and is ignored when applying the X-millisecond threshold.

When a receiver clock jump occurs, all measurements jump simultaneously. For example, a clock jump of 1ms will cause all the pseudoranges to jump by 0.001s * velocity_of_light = 299792.458m. The jump is applied on both the pseudoranges and the carrier phase measurements, and hence will not be seen on a code-minus-phase plot.

The cumulated clock jumps since the last reset of the receiver is reported in the CumClkJumps field of the MeasEpoch SBF block.

As can be seen in Figure 2-1, the initial clock bias is not necessarily zero, but it can take any value within -0.5ms and +0.5ms. This is the default configuration. You can use the second argument of the **setClockSyncThreshold** command to force the clock bias to be close to zero (typically <100ns) at startup. When this feature is enabled, a jump of a non-integer number of milliseconds is applied right after the first position fix, followed by a short loss of signal tracking.

2.3.2 Clock Steering

In steered mode, the receiver time is continuously steered to a GNSS time. The particular time realization (GPS, Galileo, BeiDou, ...) is generally irrelevant as the difference is very small. It can be selected with the **setTimingSystem** command if needed.

In the example of Figure 2-1, if the user would have enabled clock steering one hour after start up of the receiver, the clock bias would have been like in Figure 2-2 below.

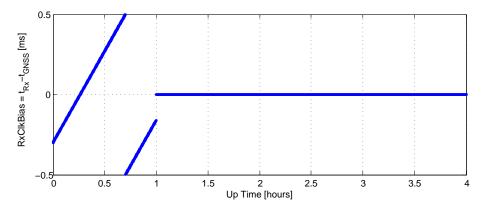

Figure 2-2: Effect of clock steering on the clock bias (clock steering enabled at an up time of 1 hour).

Clock steering accuracy is dependent on the satellite visibility, and it is recommended to only enable it under open-sky conditions.

Bit 3 of the CommonFlags field of the MeasEpoch SBF block indicates whether clock steering is active or not.

Note for the users of a GNSS constellation simulator:

When using a constellation simulator, it is mandatory to reset the receiver before every (re)start of the simulation and to clear all satellite and PVT data stored in its non-volatile memory. This can be done by entering the **exeResetReceiver**, **Hard**, **PVTData+SatData** command.

If the only simulated signals are the legacy L1 and L2 GPS and GLONASS signals, make sure to set the simulation time after December 31, 2023. The receiver time will be incorrect before that date.

2.4 Computation of Position, Velocity, and Time (PVT Solution)

The receiver computes the position, velocity and time (PVT) based on the pseudoranges, the Doppler measurements and, if applicable, the differential corrections.

The availability of the PVT depends on:

- the number of available pseudoranges and Doppler measurements, equal to the number of tracked satellites, or a subset of them as specified by the setSatelliteUsage command;
- the number of valid sets of broadcast ephemerides, which are needed to compute the position, velocity, and clock bias for each tracked satellite;
- the number of valid sets of fast and long-term SBAS corrections and their age in the case of SBAS-aided positioning;
- the number of valid differential corrections and their age in the case of DGNSS/RTK positioning.

A position fix requires a minimum of 4 tracked satellites with associated ephemerides. When a PVT solution is not available, PVT-related SBF blocks are still output with all the numeric

fields set to Do-Not-Use values, and with the Error field set to indicate the source of the problem.

The accuracy of the PVT depends on:

- The signal level.
- The geometry of the satellite constellation expressed in the DOP values: these values indicate the ratio of positional errors to range errors and are computed on the basis of the error propagation theory. When the DOP is high, the accuracy of positioning will be low.
- The number of available satellites: the more satellites are available, the lower the DOP. Measurement redundancy also enables better outlier detection.
- Multipath errors on the pseudorange measurements: multipath errors can be largely attenuated by enabling the APME multipath mitigation method (see setMultipathMitigation) and/or using code smoothing (see setSmoothingInterval).
- The PVT mode as set by the **setPVTMode** command.
- The data available to compute ionospheric delays (see **setIonosphereModel**).
- The choice of the dynamics model: if the dynamics parameter set by the **setReceiverDynamics** command does not correspond to the actual dynamics of the receiver platform, the position estimation will be sub-optimal.

The a-posteriori accuracy estimate of the computed position is reported in the variance-covariance matrix, which comes in the PosCovCartesian and PosCovGeodetic SBF blocks. This accuracy estimate is based on the assumed measurement noise model and may differ from actual errors due to many external factors, most of all multipath.

2.4.1 SBAS Positioning

SBAS, which stands for 'Space Based Augmentation System', enables differential operation over a large area with associated integrity information. System errors are computed from a dataset recorded over a continental area and disseminated via a geostationary satellite. The operation of SBAS is documented in the RTCA DO 229 standard. SBAS improves over DGNSS corrections, in that it provides system corrections (ionosphere corrections and ephemeris long-term corrections) next to range corrections (the "fast corrections" in the DO 229 terminology).

The receiver provides an SBAS-aided position when it has sufficient satellites with at least fast and long-term corrections. The corrections are used as long as their applicability has not timed out. During the time-out interval the receiver applies correction degradation using the information received in message type (MT) 07 and 10.

By default, the receiver selects the SBAS satellite with the most SBAS corrections available. With the **setSBASCorrections** command, it is possible to force the receiver to use a particular SBAS satellite or a particular SBAS provider.

2.4.2 DGNSS Positioning

DGNSS (Differential GNSS) is a pseudorange-based positioning technique where GNSS system errors are reduced by the use of range corrections. To work in DGNSS rover mode, the receiver needs to receive differential corrections.

Note on the RTCM v2.x corrections: the receiver takes the τ_{gd} parameter transmitted by the GPS satellites into account during the computation of the pseudorange corrections, as prescribed in v2.2 and v2.3 of the RTCM standard. The RTCM standard version 2.1 is ambiguous in this respect: it does neither prescribe nor discourage the use of τ_{gd} . The receiver can be configured in both modes using the command **setRTCMv2Compatibility**.

2.4.3 RTK Positioning

Real-Time Kinematic (RTK) is a carrier phase positioning method where the carrier phase ambiguities are estimated in a kinematic mode.

To work in RTK mode, the receiver requires the reception of RTK messages in the RTCM or CMR format. The base station providing these RTK messages can be either static or moving. Multiple-base RTK is not supported: by default, the receiver selects the nearest base station if more than one base station is available.

In RTK mode, the absolute position is reported in the PVTCartesian or PVTGeodetic SBF blocks, and the baseline vector is reported in the BaseVectorCart and BaseVectorGeod SBF blocks.

2.4.3.1 Integer Ambiguities (RTK-fixed)

The key to high-accuracy carrier phase positioning is the fixing of the carrier phase integer ambiguities. Under normal circumstances the receiver will compute the integer ambiguities within several seconds and yield an RTK-fixed solution with centimeter-level accuracy. The less accurate pseudorange measurements will not be used. As long as no cycle slips or loss-of-lock events occurs, the carrier phase position is readily available.

RTK with fixed ambiguities is also commonly referred to as phase positioning using 'On-The-Fly' (OTF) ambiguity fixing. The RTK positioning engine of the receiver uses the LAMBDA method⁽¹⁾ developed at Delft University, department of Geodesy.

2.4.3.2 Floating Ambiguities (RTK-float)

When data availability is low (e.g. low number of satellites) or when the data are not of sufficient quality (high multipath), the receiver will not fix the carrier phase ambiguities to their integer value, but will keep them floating. At the start of the RTK-float convergence process, the position accuracy is equal to that of code-based DGNSS. Over the course of several minutes the positional accuracy will converge from several decimeters to several centimeters as the floating ambiguities become more accurate.

⁽¹⁾ Teunissen, P.J.G., and C.C.J.M. Tiberius (1994) Integer least-squares estimation of the GPS phase ambiguities. Proceedings of International Symposium on Kinematic Systems in Geodesy, Geomatics and Navigation KIS'94, Banff, Canada, August 30-September 2, pp. 221-231.

2.4.3.3 Moving Base

In RTK, the base station does not necessarily need to be static. In some applications, one is interested in the relative positioning of two moving vehicles. In that case, both base and rover receivers are mounted on moving platforms and the RTK engine computes the baseline between them. If both base and rover receivers are mounted on the same vehicle, the baseline can be used to determine the orientation of the vehicle (see section 1.9). If accurate absolute positioning is required in addition to relative positioning, the moving base receiver can operate in RTK mode and get RTK correction from a fixed base station (see section 1.7.2).

With the command **setDiffCorrUsage**, the rover receiver must be informed that the base is moving. The baseline coordinates and orientation is contained in the BaseVectorCart and BaseVectorGeod SBF blocks.

Due to delays in the generation and transmission of the RTK data (base station position and measurements) from the base to the rover, the RTK data has a certain "age" when received by the rover. When operating with a moving base station, the RTK engine is of the "low-latency" type. This means that, when the rover computes its RTK position at time t_0 , it extrapolates the most recently received RTK data from the base to time t_0 . The accuracy of this extrapolation, and hence the accuracy of the final RTK solution, degrades with the age of the RTK data. Therefore it is essential that the base sends its position and measurements at a sufficient rate.

The default rate of 1 Hz is adequate in the case of a static base station, but is generally too low for a moving base with a non-constant velocity. In moving base operation, it is recommended to set the RTK data rate to its maximum allowed value of 10 Hz. Not only the RTK data rate, but also the communication link latency is important. Especially in moving base, it is essential to have a low-latency communication link between base and rover.

2.4.4 Transition between PVT Modes

Whenever possible, the transitions from a more accurate PVT mode to a less accurate PVT mode are smooth. For example, when switching from RTK to DGNSS mode, the position does not exhibit a sudden jump, but slowly degrades from RTK to DGNSS accuracy.

2.4.5 PVT Latency

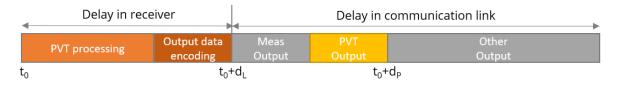

Figure 2-3: PVT latency.

The total PVT latency is the delay between the time of applicability of the PVT (t_0) and its availability to the user application (t_0 + d_P). It is the sum of the PVT processing time, the output data encoding time, and the time needed to transmit the data over the communication link. The processing and encoding time (d_L) is measured by the receiver and is reported in the Latency field of the PVTCartesian and PVTGeodetic SBF blocks. The communication

latency (grey and yellow bars) entirely depends on the communication link and is unknown to the receiver. Serial ports configured at high baud rate generally yield the shortest latency. When transferring data over IP, latency can be reduced by operating in UDP mode (see the **setIPServerSettings** command).

The shortest total PVT latency is obtained when the receiver only needs to output PVT data (e.g. only the PVTCartesian SBF block). Latency increases when more data need to be output. Note that the receiver always outputs raw measurements, e.g. the MeasEpoch SBF block, before PVT data. Therefore, when using slow communication links, enabling the measurement output can have a significant impact on the total PVT latency.

2.4.6 Datum Transformation

By default the datum to which the coordinates refer depends on the positioning mode. For standalone and SBAS positioning for example, the coordinates refer to a global datum: WGS84 or ITRS. When using DGNSS or RTK corrections from a DGNSS/RTK provider, the coordinates usually refer to a regional datum (e.g. ETRS89 in Europe).

Recent realisations of WGS84 and ITRS are closely aligned and the difference can be neglected in most cases. The receiver considers them equivalent. However, regional datums may significantly differ from WGS84/ITRS, which may lead to coordinate jumps when switching between different positioning modes.

2.4.6.1 Transformation to Regional Datum

It is possible to avoid this datum shift by configuring the receiver to transform all coordinates to the regional datum used by the RTK base stations. This is done with the **setGeodeticDatum** command. The receiver knows the transformation parameters applicable to the most common datums (e.g. ETRS89 or NAD83), but user datums can also be defined with the **setUserDatum** command.

Coordinates in the PVTCartesian and PVTGeodetic SBF blocks refer to the datum selected in **setGeodeticDatum**. The datum can be checked by decoding the Datum field of these blocks.

2.4.6.2 Transformation to Local Datum

Sometimes it is needed to relate the coordinates to a local datum. Some RTK networks provide the necessary transformation and projection parameters as part of their RTCM stream, in message types 1021 to 1027.

The local geodetic coordinates (latitude, longitude and height) are reported in the PosLocal SBF block, and the plane grid coordinates (easting, northing, height) are reported in the PosProjected SBF block.

The following conditions must be met for the receiver to provide local coordinates from the information sent by the RTK network:

• the usage of RTCM v3.x MT1021-1027 must be enabled by the command **setRTCMv3Usage** (these messages are enabled by default).

- the local coordinate operations must be set to NETWORK with the **setLocalCoordOperation** command (this is the default).
- the complete set of datum transformation messages must have been received from the network. Plane grid coordinates are only available if the network supports one of the messages in the 1025-1027 range. Otherwise, only the local latitude, longitude and height are available.
- the position must be in the area of validity of the transformation parameters.
- to continue to get unbiased local coordinates when the positioning mode is not DGNSS or RTK, the network regional datum must be set with the **setGeodeticDatum** command. See section 2.4.6.1.

A number of local datum transformations are preloaded in the receiver (the list can be retrieved with the <code>lstLocalCoordOperations</code> command). If your local datum belongs to this list, local coordinates can be computed without information from the RTK network. See the <code>setLocalCoordOperation</code> command for details.

2.5 Antenna Effects

To achieve the highest positioning precision, it is essential to take antenna effects into account.

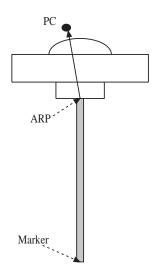

Figure 2-4: Antenna mount.

The GNSS measurements (pseudoranges and carrier phases observables) refer to a theoretical point in space called the phase center (noted PC in Figure 2-4). The position of this point is dependent on the elevation of the satellite and on the frequency band. It varies with time and it is different for the different GNSS frequency bands. The phase center variation can reach a few centimeters.

If no correction is applied, the computed position refers to an average phase center with no easy link with the antenna physical element. This average phase center fluctuates with time and cannot be used for accurate millimeter-level positioning.

For high-precision positioning, the GNSS measurements need to be corrected in such a way that they all refer to a common and stable point in space. That point is referred to as the antenna reference point (ARP). For convenience, it is usually selected at the center of the

bottom surface of the antenna. PC to ARP calibration tables are available on Internet for a large number of geodetic-grade antennas. For example, the National Geodetic Survey (NGS) publishes calibration tables that can be downloaded from the following URL:

https://www.ngs.noaa.gov/ANTCAL/.

The antenna naming convention in such table is the one adopted by the IGS Central Bureau.

The receiver has a similar table in its non-volatile memory. This table can be upgraded following the standard upgrade procedure as described in section 1.25.

2.5.1 Antenna Effects in Rover Mode

If the user specifies the type of his/her antenna using the **setAntennaOffset** command, the receiver compensates for the phase center variation in all rover positioning modes. If the antenna is not specified, or the antenna type is not present in the built-in antenna calibration file, the receiver cannot make the distinction between phase center and ARP, and the position accuracy is slightly degraded, especially in the height component.

The point to be positioned is the "marker" (see Figure 2-4). The offset between the ARP and the marker is a function of the antenna monumentation. It must be measured by the user and specified with the **setAntennaOffset** command.

The absolute position reported in the PVTCartesian and PVTGeodetic SBF blocks is always the marker position.

In DGNSS or RTK modes, the receiver needs to know the type of antenna used at the base station in order to properly compensate for the phase center variation at the base. This information is typically included in the correction stream received from the base station.

The base-to-rover baseline coordinates in the BaseVectorCart and BaseVectorGeod SBF blocks is from ARP to ARP unless the receiver is not able to properly compensate for the phase center variation at base or rover. Refer to the description of the BaseVectorCart SBF blocks for details.

2.5.2 Antenna Effects in Base Mode

Phase center compensation always happens at the rover side. The base station sends uncompensated measurements in its differential correction messages, together with its ARP position and antenna type. The antenna type information allows the rover to apply the appropriate phase center compensation to the base measurements.

When setting up a base station, it is therefore important that the coordinates entered with the **setStaticPosGeodetic** or the **setStaticPosCartesian** commands refer to the ARP. The coordinates are encoded without change in the relevant differential correction messages. The antenna type must be provided with the **setAntennaOffset** command.

2.6 Galileo OSNMA

The receiver supports Galileo Open-Service Navigation Message Authentication (OSNMA), when enabled with the **setGalOSNMAUsage** command.

The authentication status is reported in the GALAuthStatus SBF block. The main steps involved in OSNMA authentication are summarized below.

- 1. The receiver may still need to gather initial information (e.g. public keys) from the Galileo satellites before being able to launch its authentication function. The initialization progress is reported in % in the OSNMAStatus field of GALAuthStatus. Once 100% is reached, all necessary information is available. The process of information gathering can take up to a few minutes, but is typically only needed once as the receiver stores the data in its non-volatile memory.
- 2. After initialization, the authentication process starts, indicated by the OSNMAStatus field of GALAuthStatus changing to authenticating. Roughly a minute after this transition, satellite authentication results are expected to become available. The ActiveMask and AuthenticMask fields indicate for which satellites authentication is available and successful.
- 3. The authentication status gets reflected in the satellite status window of RxControl, as shown below.

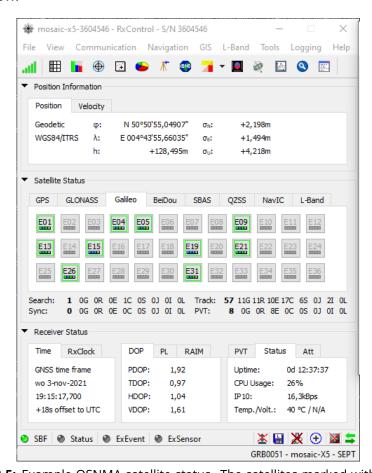

Figure 2-5: Example OSNMA satellite status. The satellites marked with a green square are successfully authenticated.

2.6.1 Use of OSNMA in Simulated Scenarios

By default, OSNMA authentication is configured to work with live Galileo signals. In case the receiver is used in a simulated environment where the OSNMA public keys and Merkle Tree

root key do not correspond with the live OSNMA keys, the following steps are needed to configure the OSNMA engine correctly:

- 1. Determine whether an NTP server (linked to the simulator) is available. If there is one, make the receiver aware of it using the **setNTPClient** command. If not, disable the NTP server connection using **setNTPClient**, **off**.
- 2. When Public Key Renewal (PKR) is not available, or to speed-up the authentication process, a user can manually introduce public keys using the **setGalOSNMAPublicKeys** command.
- 3. In case the PKR feature is needed, the appropriate Merkle Tree root key needs to be introduced using the second argument of the **setGalOSNMAUsage** command.

Chapter 3

Command Line Reference

3.1 Command Line Interface Outline

The receiver outputs a prompt when it is ready to accept a user command. The prompt is of the form:

CD>

where \mbox{CD} is the connection descriptor of the current connection, e.g. COM1 (see section 1.2.5).

The prompt indicates the termination of the processing of a given command. When sending multiple commands to the receiver, it is necessary to wait for the prompt between each command.

Sometimes a connection is not configured to accept user commands, for example because it is put into differential correction input mode. A way to force a connection to accept commands is to send a succession of ten "S" characters to that connection and then to press the enter key (SSSSSSSSSCCR>). See also the description of the **setDataInOut** command.

3.1.1 Command Types

Most commands fall into one of the following categories:

set-commands to change one or more configuration parameters;

get-commands to get the current value of one or more configuration parameters;

exe-commands to initiate some action;

1st-commands to retrieve the contents of internal files or list the commands.

Each **set**-command has its **get**-counterpart, but the opposite is not true. For instance, the **setNMEAOutput** command has a corresponding **getNMEAOutput**, but **getReceiverCapabilities** has no **set**-counterpart. Each **exe**-command also has its **get**-counterpart which can be used to retrieve the parameters of the last invocation of the command.

3.1.2 Command Line Syntax

Each ASCII command line consists of a command name optionally followed by a list of arguments and terminated by <CR>, <LF> or <CR><LF> character(s) usually corresponding to pressing the "Enter" key on the keyboard.

To minimize typing effort when sending commands by hand, the command name can be replaced by its 3-5 character mnemonic. For instance, grc can be used instead of getReceiverCapabilities.

The receiver is case insensitive when interpreting a command line.

The maximum length of any ASCII command line is 2000 characters.

For commands requiring arguments, the comma "," must be used to separate the arguments from each other and from the command's name. Any number of spaces can be inserted before and after the comma.

Each argument of a **set**-command corresponds to a single configuration parameter in the receiver. Usually, each of these configuration parameters can be set independently of the others, so most of the **set**-command's arguments are optional. Optional arguments can be omitted but if omitted arguments are followed by non-omitted ones, a corresponding number of commas must be entered. Omitted arguments always keep their current value.

3.1.3 Command Replies

The reply to ASCII commands always starts with "\$R" and ends with <CR><LF> followed by the prompt corresponding to the connection descriptor you are connected to.

The following types of replies are defined for ASCII commands:

• For comment lines (user input beginning with "#") or empty commands (just pressing "Enter"), the receiver replies with the prompt.

```
COM1> # This is a comment! <CR>
COM1>
```

- For invalid commands, the reply is an error message, always beginning with the keyword "\$R?" followed by an error message.
- For all valid **set**-, **get** and **exe**-commands, the first line of the reply is an exact copy of the command as entered by the user, preceded with "\$R:". One or more additional lines are printed depending on the command. These lines report the configuration of the receiver after execution of the command.

```
COM1>setNMEAOutput, stream1, com1, GGA, sec1 <CR>
$R: setNMEAOutput, stream1, com1, GGA, sec1
   NMEAOutput, stream1, com1, GGA, sec1
COM1>
```

For commands which reset or halt the receiver (e.g. **exeResetReceiver**), the reply is terminated by "STOP>" instead of the standard prompt, to indicate that no further command can be entered.

• For all valid **lst**-commands, the first line of the reply is an exact copy of the command as entered by the user, preceded with "\$R;". The second line is a pseudo-prompt "--->" and the remaining of the reply is a succession of formatted blocks, each of them starting with "\$-- BLOCK".

ASCII replies to **set-**, **get-** and **exe-**commands, including the terminating prompt, are atomic: they cannot be broken by other messages from the receivers. For the **1st-**commands, the replies may consist of several atomic formatted blocks which can be interleaved with other output data. If more than one formatted block is output for a lst-command, each of the intermediate blocks is terminated with a pseudo-prompt "———>". The normal prompt will only be used to terminate the last formatted block of the reply so that one single prompt is always associated with one command.

3.1.4 Command Syntax Tables

All ASCII commands are listed in section 3.2. Each command is introduced by a compact formal description of it called a "syntax table". Syntax tables contain a complete list of arguments with their possible values and default settings when applicable.

The conventions used in syntax tables are explained below by taking a fictitious **setCommandName** command as example. The syntax table for that command is:

scn	setCommandName	Cd	Distance	Time	Message (120)	Password (40/2)	Mode	PRN
gcn	getCommandName	Cd						
		+ Com1	-20.00 <u>0.00</u> 20.00	<u>1</u> 50 sec	<u>Unknown</u>		<u>on</u>	none
		+ Com2	m				off	+ G01 G36
		all						+ S120 S158
								+ SBAS
								+ GPS
								all

GUI: Navigation > Receiver Operation > Example

The associated **set**- and **get**-commands are always described in pairs, and the same holds for the associated **exe**- and **get**-commands. The command name and its equivalent 3-5 character mnemonic are printed in the first two columns. The list of arguments for the set- and get-commands is listed in the first and second row respectively. In our example, **setCommandName** can accept up to 6 arguments and **getCommandName** only accepts one argument. Mandatory arguments are printed in bold face. Besides the mandatory arguments, at least one of the optional arguments must be provided in the command line.

The list of possible values for each argument is printed under each of them. Default values for optional arguments are underlined.

The link printed in blue under the syntax table shows under which GUI menu the command can be found.

The fictitious command above contains all the possible argument types:

• *Cd* serves as an index for all following arguments. This can be noticed by the possibility to use this argument in the **get**-command. This argument is mandatory in the **set**-command. The accepted values are COM1, COM2 and all, corresponding to the first or second serial ports, or to both of them respectively. The "+" sign before the first two values indicates that they can be combined to address both serial ports in the same command.

Examples: COM1, COM1+COM2, all (which is actually an alias for COM1+COM2).

• *Distance* is a number between -20 and 20 with a default value of 0, and up to 2 decimal digits. An error is returned if more digits are provided. The "m" indicates that the value is expressed in meters. Note that this "m" should not be typed when entering the command.

```
Examples: 20, 10.3, -2.34
```

• *Time* is a number between 1 and 50, with no decimal digit (i.e. this is an integer value). This value is expressed in seconds.

```
Examples: 1, 10
```

• *Message* is a string with a maximum length of 120 characters. The default value of that argument is "Unknown". When spaces are required, the string has to be put between quotes and these enclosing quotes are not considered part of the string. The list of allowed characters in strings is:

```
ABCDEFGHIJKLMNOPQRSTUVWXYZabcdefghijklmnopqrstuvwxyz0123456789 !#%@()*+-./:;<=>?[\]^_`{|}~
```

Example: "Hello World!"

 Password is a password argument with a maximum usable length of 20 characters (40/2). Only half of the total password length is available to the user, the other half being reserved by the system. Password arguments are obfuscated by the receiver and they cannot be read back in plaintext in command replies, unless explicitly specified otherwise.

In addition to the characters above (see the *Message* argument), special characters are allowed in passwords using the corresponding escape sequence:

- Type %%DQ to obtain "
- Type %%SQ to obtain '
- Type %%DL to obtain \$
- Type %%AM to obtain &
- Type %%CM to obtain ,

Example: "ab%%AM123"

• *Mode* is a range of individual values that cannot be combined (they are not preceded by a "+" sign). Either off or on can be selected for that argument and the default value is on.

Example: on

PRN is a range of values that can be combined together with the "+" sign. The default value GPS is an alias for G01+G02+ . . . +G36, SBAS is an alias for S120+ . . . +S158 and all an alias for GPS+SBAS. A "+" sign can be set before the argument to indicate to add the specified value(s) to the current list. If the value "none" is supported (which is the case in this example), a "-" sign can be set before the argument to remove the specified value(s) from the current list. It is possible to add or remove multiple values at once by "adding" or "subtracting" them with the "+" or "-" operator. However, "+" and "-" can never be combined in a single argument.

Examples: G01+G02, +G03, GPS+S120, +G04+G05, -S122-S123, -GPS

3.2 Command Definitions

3.2.1 Receiver Administration

lai	IstAntennalnfo	Antenna				
		Overview				
		Main				
		[antenna name]				
						!

Use this command with the argument *Antenna* set to Overview to get a list of all antenna names for which the receiver knows the phase center variation parameters (see section 2.5).

Use this command with the argument *Antenna* set to one of the antenna names returned by **lstAntennaInfo**, **Overview** to retrieve the complete phase center variation parameters for that particular antenna. Do not forget to enclose the name between double quotes if it contains whitespaces.

Using the values Main will return the phase center variation parameters corresponding to the main antenna type as specified in the command **setAntennaOffset**.

Examples

```
COM1> lai, Overview <CR>
$R; lai, Overview
<?xml version="1.0" encoding="ISO-8859-1" ?>
<AntennaInfo version="22.1.0">
 <Antenna ID="3COAG35
                              NONE"/>
 <Antenna ID="3COAG35H
                               NONE"/>
 <Antenna ID="3COAT-703
                               NONE"/>
 <Antenna ID="3COAT-705
                               NONE"/>
 <Antenna ID="3COAT901
                               NONE"/>
  <Antenna ID="WIEGPOT206-003 NONE"/>
</AntennaInfo>
COM1>
COM1> lai, "AERAT2775_159 SPKE"<CR>
$R; lai, "AERAT2775_159 SPKE"
<?xml version="1.0" encoding="ISO-8859-1" ?>
<AntennaInfo version="22.1.0">
  <Antenna ID="AERAT2775_159 SPKE"/>
   <L1>
      <offset north="0.5" east="0.1" up="77.8"/>
      <phase elevation="90" value="0.0"/>
      <phase elevation="85" value="-0.2"/>
      <phase elevation=" 5" value="0.0"/>
      <phase elevation=" 0" value="0.0"/>
    </L2>
</AntennaInfo>
COM1>
```

h	nelp	IstCommandHelp	Action (255)				
			Overview				
			[command]				

Use this command to retrieve a short description of the ASCII command-line interface.

When invoking this command with the Overview argument, the receiver returns the list of all supported **set**-, **get**- and **exe**-commands. The **lstCommandHelp** command can also be called with any supported **set**-, **get**- or **exe**-command (the full name or the mnemonic) as argument.

The reply to this command is free-formatted and subject to change in future versions of the receiver's software. This command is designed to be used by human users. When building software applications, it is recommended to use the formal **lstMIBDescription**.

Examples

```
COM1> help, Overview <CR>
$R; help, Overview
$-- BLOCK 1 / 0
MENU: communication
  GROUP: ioSelection
    sdio, setDataInOut
   gdio, getDataInOut
COM1>
COM1> help, getReceiverCapabilities <CR>
$R; help, getReceiverCapabilities
... Here comes a description of getReceiverCapabilities ...
COM1>
COM1> help, grc <CR>
$R; help, grc
... Here comes a description of getReceiverCapabilities ...
COM1>
```

lcf	IstConfigFile	File				
		Current				
		Boot				
		RxDefault				
		User1				
		User2				

Use this command to list the contents of a configuration file. A configuration file contains the list of user commands needed to bring the receiver from factory default to a certain non-default configuration.

Permanent commands (those commands that are not erased even after a reset to factory default) are prepended with a # sign.

The following configuration files are available:

File	Description
Current	The current configuration.
Boot	The configuration that is loaded at boot time, after a power cycle or after a hard reset (see also the exeResetReceiver command).
RxDefault	The default configuration.
User1	A user-defined configuration.
User2	A user-defined configuration.

See also the related **exeCopyConfigFile** command to learn how to manage configuration files.

Example

```
COM1> smp, TestMarker <CR>
$R: smp, TestMarker
  MarkerParameters, "TestMarker"
COM1> lcf, Current <CR>
$R; lcf, Current
$-- BLOCK 1 / 1
  setMarkerParameters, "TestMarker"
COM1>
```

eccf	exeCopyConfigFile	Source	Target				
gccf	getCopyConfigFile						
		Current	Current				
		Boot	Boot				
		User1	User1				
		User2	User2				
		RxDefault					

RxControl: File > Copy Configuration

Use this command to manage the configuration files. See the **lstConfigFile** command for a description of the different configuration files.

With this command, the user can copy configurations files into other configuration files. For instance, copying the Current file into the Boot file makes that the receiver will always boot in the current configuration.

Examples

To save the current configuration in the Boot file, use:

```
COM1> eccf, Current, Boot <CR>
$R: eccf, Current, Boot
   CopyConfigFile, Current, Boot
COM1>
```

To load the configuration stored in User1, use:

```
COM1> eccf, User1, Current <CR>
$R: eccf, User1, Current
   CopyConfigFile, User1, Current
COM1>
```

setEthernetMode getEthernetMode	Enable				
	off on				

RxControl: Communication > Network Settings > General

Use this command to turn the Ethernet interface on or off.

Pefore turning Ethernet off, make sure that the receiver will still be accessible through another interface (serial, USB,...). This is especially important for remote receivers. It will not be possible to access the receiver over Ethernet after invoking the setEthernetMode, off command.

1 This is a permanent command: it is automatically stored in the boot configuration file with out needing to call exeCopyConfigFile, and it is not erased even after a reset to factory defaults (see the exeResetReceiver command).

```
COM1> seth, on<CR>
$R: seth, on
  EthernetMode, on
COM1>
```

efup gfup	exeFTPUpgrade getFTPUpgrade	Server (64)	Path (64)	Login (12)	Password (24/2)			
				anonymous				

RxControl: File > Upgrade Receiver using FTP

Use this command to upgrade the receiver by fetching the upgrade file from an FTP server. The arguments specify the FTP server, the path to the upgrade file (.SUF format), and the login and password to use.

The *Server* argument is used to specify the FTP server's hostname or IP address. To communicate with the FTP server, the default FTP port 21 will be used.

The *Path* argument specifies the path of the upgrade file on the FTP server.

For the *Path* and *Login* arguments spaces are not accepted.

This procedure always resets the receiver, even if the upgrade file does not exist.

Before resetting, the receiver broadcasts a "\$TE ResetReceiver" message to all active communication ports, to inform all users of the imminent reset.

After a reset, the user may have to adapt the communication settings of his/her terminal program as they may be reset to their default values.

⁽¹⁾ Only half of the total password length is available to the user (See Section 3.1.4 on page 66)

sgpf	setGPIOFunctionality	GPPin	Mode	Input	Output			
ggpf	getGPIOFunctionality	GPPin						
		+ GP1	Output	<u>none</u>	<u>LevelLow</u>			
		+ GP2			LevelHigh			
		all						

RxControl: Navigation > Receiver Operation > GPIO

Use these commands to define/inquire the functionality assigned to every GPIO pin.

Currently, only the output pins (GPx) can be controlled by this command, and the *Mode* and *Input* arguments can only take the values Output and none respectively. The argument *Output* sets the electrical level to be applied to the pin specified in *GPPin*.

In housed products, the number of GPIO pins configurable by this command is larger than the number of GPIO pins available to the user. The extra pins are used for internal purposes, and their settings should not be modified. Please refer to the Hardware Manual or the User Manual of your product to check which GPIO pins are available.

```
COM1> sgpf, GP1, Output, none, LevelHigh
$R: sgpf, GP1, Output, none, LevelHigh
   GPIOFunctionality, GP1, Output, none, LevelHigh
COM1>
```

		Permissions				
		Identification				
		Debug				
		Error				
		SisError				
		DiffCorrError				
		SetupError				
		IPParameters				
		RxMessages				
		License				

Use this command to retrieve the contents of one of the receiver internal files:

File	Description
Permissions	List of permitted options in your receiver.
Identification	Information about the different components being part of the receiver (e.g. serial number, firmware version, etc.).
Debug	Program flow information that can help support engineers to debug certain issues.
Error	Last internal error reports.
SisError	Last detected signal-in-space anomalies.
DiffCorrError	Last detected anomalies in the incoming differential correction streams.
SetupError	Last detected anomalies in the receiver setup.
IPParameters	Hostname, MAC and IP addresses, DNS addresses, netmask and gateway.
RxMessages	Event log from the receiver. This is the list of the recent event log messages. These messages are also available in the RxMessage SBF block.
License	The license file associated with the receiver.

```

glm	getLEDMode						
		DIFFCORLED	DIFFCORLED				
		<u>PVTLED</u>	PVTLED				
		TRACKLED	TRACKLED				
		LOGLED	LOGLED				
		RTKLED	RTKLED				

RxControl: Navigation > Receiver Operation > GPIO

Use this command to define/inquire the blinking mode of the General Purpose LED(s).

The different LED blinking modes are described in the Hardware Manual or in the User Manual of your receiver.

Example

COM1> slm, DIFFCORLED <CR>
\$R: slm, DIFFCORLED
 LEDMode, DIFFCORLED
COM1>

Imd	IstMIBDescription	File (255)				
		Overview				
		SBFTable				
		[command]				

Use this command to retrieve the ASN.1-compliant syntax of the user command interface. The name of the command refers to the MIB (Management Information Base), which holds the whole receiver configuration. There is a one-to-one relationship between the formal MIB description and the ASCII command-line interface for all exe-, get- and set-commands.

When the value <code>Overview</code> is used, the general syntax of the interface is returned. With the value <code>SBFTable</code>, the receiver will output the list of supported SBF blocks and whether they can be output at a user-selectable rate or not. The <code>lstMIBDescription</code> command can also be called with every supported <code>set-</code>, <code>get-</code> or <code>exe-command</code> (the full name or the mnemonic) as argument.

No formal description of the **lst**-commands can be retrieved with **lstMIBDescription**.

```
COM1> lmd, Overview <CR>
$R; lmd, Overview
... Here comes the generic command syntax ...

COM1>

COM1> lmd, grc <CR>
$R; lmd, grc
... Here comes the description of getReceiverCapabilities ...

COM1>
```

grc	getReceiverCapabilities					

RxControl: Help > Receiver Interface > Permitted Capabilities

Use this command to retrieve the so-called "capabilities" of your receiver. The first returned value is the list of supported antenna(s), followed by the list of supported signals, the list of available communication ports and the list of enabled features.

The three values at the end of the reply line correspond to the default measurement interval, the default PVT interval and the default integrated INS/GNSS interval respectively. This is the interval at which the corresponding SBF blocks are output when the OnChange rate is selected with the **setSBFOutput** command. These values are expressed in milliseconds.

Each of the above-mentioned lists contain one or more of the elements in the tables below.

Antennas	Description
Main	The receiver's main antenna.

Signals	Description
GPSL1CA	GPS L1 C/A signal.
GPSL1PY	GPS L1 P(Y) signal.
GPSL2PY	GPS L2 P(Y) signal.
GPSL2C	GPS L2 C signal.
GPSL5	GPS L5 signal.
GLOL1CA	GLONASS L1 C/A signal.
GLOL2P	GLONASS L2 P signal.
GLOL2CA	GLONASS L2 C/A signal.
GLOL3	GLONASS L3 signal.
GALE1BC	Galileo E1 BC signal.
GALE6BC	Galileo E6 BC signal.
GALE5a	Galileo E5a signal.
GALE5b	Galileo E5b signal.
GALE5	Galileo E5 AltBOC signal.
GEOL1	SBAS L1 C/A signal.
GEOL5	SBAS L5 signal.
BDSB1I	BeiDou B1I signal.
BDSB2I	BeiDou B2I signal.
BDSB3I	BeiDou B3I signal.
BDSB1C	BeiDou B1C signal.
BDSB2a	BeiDou B2a signal.
BDSB2b	BeiDou B2b signal.

Signals (Continued)	Description
QZSL1CA	QZSS L1 C/A signal.
QZSL2C	QZSS L2 C signal.
QZSL5	QZSS L5 signal.
QZSL1CB	QZSS L1 C/B signal.
LBAND	MSS L-Band signal.
NAVICL5	NavIC/IRNSS L5 signal.

ComPorts	Description
COM1	Serial port 1.
COM2	Serial port 2.
COM3	Serial port 3.
COM4	Serial port 4.
USB1	USB-device virtual serial port 1.
USB2	USB-device virtual serial port 2.
IP10	TCP/IP port 1.
IP11	TCP/IP port 2.
IP12	TCP/IP port 3.
IP13	TCP/IP port 4.
IP14	TCP/IP port 5.
IP15	TCP/IP port 6.
IP16	TCP/IP port 7.
IP17	TCP/IP port 8.
NTR1	NTRIP port 1.
NTR2	NTRIP port 2.
NTR3	NTRIP port 3.
NTR4	NTRIP port 4.

		+USB1					
		+USB2					
		+ IP10 IP17					
		all					

RxControl: Communication > Registration

Use these commands to define/inquire the name of the application that is currently using a given connection descriptor (Cd - see 1.2.5).

Registering an application name for a connection does not affect the receiver operation, and is done on a voluntary basis. Application registration can be useful to developers of external applications when more than one application is to communicate with the receiver concurrently. Whether or not this command is used, and the way it is used is up to the developers of external applications.

```
COM1> era, com1, MyApp <CR>
$R: era, com1, MyApp

RegisteredApplications, COM1, "MyApp"

RegisteredApplications, COM2, "Unknown"

RegisteredApplications, COM3, "Unknown"

RegisteredApplications, USB1, "Unknown"

RegisteredApplications, USB2, "Unknown"

COM1>
```

erst	exeResetReceiver	Level	EraseMemory				
grst	getResetReceiver						
		Soft	none				
		Hard	+ Config				
		Upgrade	+ PVTData				
			+ SatData				
			+ TLSCertificate				
			+ SISAuthData				
			all				

RxControl: File > Reset Receiver

Use this command to reset the receiver and to erase some previously stored data. The first argument specifies which level of reset you want to execute:

Level	Description
Soft	This is a reset of the receiver's firmware. After a few seconds, the receiver will restart operating in the same configuration as before the command was issued, unless the "Config" value is specified in the second argument.
Hard	This is similar to a power off/on sequence. After hardware reset, the receiver will use the configuration saved in the boot configuration file.
Upgrade	Set the receiver into upgrade mode. After a few seconds, the receiver is ready to accept an upgrade file (SUF format) from any of its connections.

The second argument specifies which part of the non-volatile memory should be erased during the reset. The following table contains the possible values for the *EraseMemory* argument:

EraseMemory	Description
Config	The receiver's configuration is reset to the factory default, with the exception of the settings set by permanent commands (see section 1.6 for details).
	After reset, the Current and Boot configuration files are erased (see the exeCopyConfigFile command), but the User1 and User2 configuration files are kept unchanged.
PVTData	The latest computed PVT data stored in non-volatile memory is erased.
SatData	All satellite navigation data (ephemeris, almanac, ionosphere parameters, UTC,) stored in non-volatile memory is erased.
TLSCertificate	Remove current SSL/TLS certificate. It will be replaced by a self-signed certificate at boot.
SISAuthData	Remove stored OSNMA data (PKR - Public Keys, floating KROOT)

Before resetting, the receiver broadcasts a "\$TE ResetReceiver" message to all active communication ports, to inform all users of the imminent reset.

After a reset, the user may have to adapt the communication settings of his/her terminal program as they may be reset to their default values.

Example

COM1> erst, soft, none <CR>
\$R: erst, soft, none
 ResetReceiver, Soft, none
STOP>
\$TE ResetReceiver Soft
STOP>

Itc	IstTLSCertificates	Certificate				
		[certificate ID]				

Use this command with the argument *Certificate* set to Overview to get a list of all X509 certificates available on the receiver.

Use this command with the argument *Certificate* set to one of the certificate IDs returned by **lstTLSCertificates**, **Overview** to retrieve informatin about that particular x509 certificate. Note that the private key corresponding to the certificate is never shown.

```

COM1>

suia guia	setUSBInternetAccess getUSBInternetAccess	Enable				
		off on				

RxControl: Communication > Network Settings > General

Use this command to enable or disable outgoing network access over USB.

If enabled, the receiver will attempt to obtain an IP address via DHCP over the USB connection. It will then be able to access the Internet through that connection, allowing, for example, to communicate with a NTRIP server. Note that this requires that Internet sharing is enabled on the computer attached to the receiver.

The IP address assigned to the receiver can be retrieved from the lstInternalFile, IPParameters command.

See also section 1.2.3.2.

This is a permanent command: it is automatically stored in the boot configuration file without needing to call exeCopyConfigFile, and it is not erased even after a reset to factory defaults (see the exeResetReceiver command).

```
COM1> suia, on<CR>
$R: suia, on
 USBInternetAccess, on
COM1>
```

3.2.2 Standby and Sleep Configuration

exePowerMode getPowerMode	Mode				
	StandBy				

RxControl: File > Power Mode > Shut Down

Use this command to set the receiver in sleep or standby mode, in which it consumes only a fraction of its normal operational power.

When in standby mode, the receiver can be awoken by sending the appropriate signal to one of its input pins (see the receiver Hardware Manual or User Manual for details).

Upon waking up, the receiver applies the configuration that is stored in the boot configuration file (see the **lstConfigFile** command).

Before entering standby mode, the receiver broadcasts a "\$TE PowerMode" message to all active communication ports, to inform all users of the imminent halt.

Example

COM1> epwm, Standby <CR>
\$R: epwm, Standby
 PowerMode, StandBy
STOP>
\$TE PowerMode Standby
STOP>

3.2.3 User Management

lcu	IstCurrentUser					

Use this command to check which user is currently logged in on this port, if any. See also the **login** command.

```
COM1> lcu <CR>
$R! lstCurrentUser
  Not logged in.
COM1> login, admin, admin <CR>
$R! LogIn
  User admin logged in.
COM1> lcu <CR>
$R! lstCurrentUser
  Logged in as admin.
COM1>
```

sdal	setDefaultAccessLevel	Web	FileTransfer	<i>lp</i>	Com	Usb		
gdal	getDefaultAccessLevel							
		<u>none</u>	<u>none</u>	<u>none</u>	none	none		
			Viewer		Viewer	Viewer		
			User		User	User		

RxControl: File > User Management

This command defines what an anonymous user is authorized to do when connected to the receiver. An anonymous user is one who has not logged in with the **login** command.

The anonymous authorization level can be set independently for the different interfaces.

For all arguments (except *FileTransfer*), setting the authorization level to User grants full control of the receiver to the anonymous user connected through the corresponding connection. The Viewer level allows the anonymous user to view the receiver configuration without changing it (i.e. to only issue **get**-commands). none prevents anonymous users from viewing or changing the configuration.

For the FileTransfer argument, Viewer means that the anonymous user is allowed to download log files, but not to delete them. User means that the anonymous user can both download and delete files, and none disables anonymous accesses.

To perform actions not allowed to anonymous users, you first need to authenticate yourself by entering a *UserName* and *Password* through the **login** command.

See also the commands **setUserAccessLevel** to learn how to define user accounts.

```
COM1> sdal, none, Viewer, none, User, none<CR>
$R: sdal, none, Viewer, none, User, none
   DefaultAccessLevel, none, Viewer, none, User, none
COM1>
```

facr	factoryReset					

This command is used to reset the receiver to its factory default state. It will erase all user settings, including the list of known users (see section 1.3), and restore the factory default configuration. The only exceptions are the setIPSettings and setIPPortSettings settings. They are kept in order to allow the receiver to be reachable after the reset.

Except for the specific case mentioned below, this command can only be entered by loggedin users (see the login command). If there are no users defined yet, it is advised to create one first following the procedure described in section 1.3.

In the specific case that all anonymous accesses to the receiver are blocked (see setDefaultAccessLevel) and that the credentials for all users are lost, the following recovery procedure can be followed. It requires physical access to the receiver and can only be executed over USB or COM connections.

- 1. Physically reset the receiver, either by a power cycle or via its reset pin.
- 2. Within 30 seconds, connect to the receiver using its USB or one of its COM ports and send the **factoryReset** command.
- 3. Within a minute, physically reset the receiver again, either by a power cycle or via its
- 4. The receiver restarts, clears its configuration, returns to factory defaults and then resets one last time.

factoryReset is a dangerous command that will erase all user settings and data. Use it with caution, and only when you are sure you want to reset the receiver to its factory defaults. In most cases, the **exeResetReceiver** command is more appropriate.

Example

Log in as user "admin" with password "admin", then issue factoryReset to reset the receiver to factory defaults.

```
login, admin, admin <CR>
COM1>
$R! LogIn
 User admin logged in.
COM1> factoryReset <CR>
$R: factoryReset: Resetting receiver to factory defaults.
COM1>
```

login	LogIn	UserName (16)	Password (32/2) (2)	FactoryUserName (1	FactoryPassword (32		
				<u>RxAdmin</u>	S3pt3ntr10		

Use this command to authenticate yourself.

When initially connecting to the receiver, a user is considered "anonymous". By default, anonymous users have full control over USB or COM ports, but they cannot enter any commands over a TCP/IP port. See also the **setDefaultAccessLevel** command.

To perform actions not allowed to anonymous users, you need to authenticate yourself by entering a valid *UserName* and *Password* through the **login** command.

The list of known user names and passwords and their respective access level can be managed with the **setUserAccessLevel** command. Login fails if the provided *UserName* or *Password* is not in that list or if *Password* is empty.

The **logout** command returns to unauthenticated (anonymous) access. The **lstCurrentUser** command can be invoked to find out which user is logged in on the current port.

Arguments FactoryUserName and FactoryPassword are optional, except when creating the first user when no user account exists yet and the anonymous user lacks permission to create one with the **setUserAccessLevel** command. If needed, these arguments must be set to RxAdmin and S3pt3ntr10 respectively. See section 1.3 for details.

It is not necessary to log out before logging in as a different user.

Examples

To log in as user "admin" with password "admin", use

```
COM1> login, admin, admin <CR>
$R! LogIn
  User admin logged in.
COM1>
```

Logging in with a wrong username or password gives an error:

```
COM1> login, foo, foo <CR>
$R? LogIn: Wrong username or password!
COM1>
```

If the user does not have sufficient access right, some commands may give an error:

```
COM1> sso, Stream1, COM1, MeasEpoch, sec1 <CR>
$R? SBFOutput: Not authorized!
COM1>
```

If no users are defined and the anonymous user is not granted access right, the extra *Facto-ryUserName* and *FactoryPassword* arguments must be provided. In that case, the command creates and logs in the first user:

```
COM1> login, myUser, myPassword, RxAdmin, S3pt3ntr10 <CR>
```

⁽²⁾ Only half of the total password length is available to the user (See Section 3.1.4 on page 66)

\$R! LogIn <CR>
 User myUser logged in.
COM1>

logout	LogOut					

Use this command to return to anonymous access. It is the reverse of login.

Example

The following sequence of commands logs in as user "admin" with password "admin", reconfigures SBF output, and logs out again:

```
COM1> login, admin, admin <CR>
$R! LogIn
   User admin logged in.

COM1> sso, Stream1, COM1, PVTCartesian, sec1 <CR>
$R: sso, Stream1, COM1, PVTCartesian, sec1
   SBFOutput, Stream1, COM1, PVTCartesian, sec1
COM1> logout <CR>
$R! LogOut
   User admin logged out.
COM1>
```

sual	setUserAccessLevel	UserID	UserName (16)	Password (32)	UserLevel	SSHKey (232)		
gual	getUserAccessLevel	UserID						
		+ User1 User8			Viewer			
		all			User			

RxControl: File > User Management

Use these commands to manage the user accounts and their access rights on the receiver. Up to eight user accounts can be defined (User1 to User8).

Each user is identified with a *UserName* and *Password*, and has a certain level of acces (*UserLevel*). If *UserLevel* is <code>User</code>, the user has full control of the receiver. If it is <code>Viewer</code>, the user can only issue <code>qet-commands</code>.

UserName and *Password* are case-sensitive. Note that the *UserName* "RxAdmin" and the *Password* "S3pt3ntr10" are reserved and cannot be used.

The SSHKey argument can be used to associate an SSH public key to a user. ECDSA, Ed25519 and RSA PEM-encoded (base64) public keys conforming to RFC 4716 are supported. The number of bits in the key must be such that the corresponding base64 public key does not exceed 232 characters. RSA keys need to be at least 1024 bits long. Whenever possible, ECDSA or Ed25519 keys are recommended for enhanced security.

When an SSH key is defined with the *SSHKey* argument, a user can download log files using SFTP, scp or rsync without the need for entering a password, provided the matching private key is known by the key agent running on his machine.

To delete an user account, use the empty string "" as *UserName* and *Password*.

Note that the receiver encrypts the password so that it cannot be read back with the command getUserAccessLevel.

```
COM1> sual, User3, Mildred, mypwd, Viewer, AAAAE2VjZH ...
   a9YSdPMw==<CR>
$R: sual, User3, Mildred, mypwd, Viewer, AAAAE2VjZH ... a9YSdPMw==
   UserAccessLevel, User3, Mildred, mypwd, Viewer, AAAAE2VjZH ...
   a9YSdPMw==
COM1>
```

3.2.4 Tracking and Measurement Generation

s	CCO	setCalibCommonDelay	CommonDelay				
g	jcco	getCalibCommonDelay					
			-10000.000 <u>0.000</u> 10000.000 ns				

RxControl: Navigation > Advanced User Settings > Delay Calibration

setCalibCommonDelay and setCalibSignalDelay are expert-level commands that can be used to compensate pseudoranges for signal delays in the reception chain (antenna, cable, amplifiers, receiver frontend, ...).

setCalibCommonDelay sets a common delay affecting all GNSS signals and setCalibSignalDelay sets additional signal-specific delays. The partitioning of delays between the two commands is at the user's discretion. The common delay could for example represent the average delay of all signals, and the signal-specific delay would then contain the per-signal deviation from the average.

The delays are compensated at the source, when generating the pseudoranges. All pseudoranges output by the receiver and used internally are corrected for the sum of the common and the signal-specific delays.

Providing non-zero delays primarily affects the receiver time determination (receiver clock bias and PPS generation). In particular, setting CommonDelay to X nanoseconds will cause the PPS pulse to come X nanoseconds earlier. Note that the same effect can be obtained with the *Delay* argument of the **setPPSParameters** command. The difference is that the latter command only moves the PPS pulse without affecting the pseudoranges.

Using these commands is completely optional. They should only be used by expert users. who understand the consequences of modifying the default values. Providing incorrect delay values can significantly degrade the performance of the receiver.

Example

COM1> scco, 65.4<CR> \$R: scco, 65.4 CalibCommonDelay, 65.400 COM1>

RxControl: Navigation > Advanced User Settings > Delay Calibration

setCalibSignalDelay and setCalibCommonDelay are expert-level commands that can be used to compensate pseudoranges for signal delays in the reception chain (antenna, cable, amplifiers, receiver frontend, ...).

Refer to the **setCalibCommonDelay** command for the command description.

Using these commands is completely optional. They should only be used by expert users who understand the consequences of modifying the default values. Providing incorrect delay values can significantly degrade the performance of the receiver.

```
COM1> scsi, GPSL5+GALE5a, -2.56<CR>
$R: scsi, GPSL5+GALE5a, -2.56
 CalibSignalDelay, GPSL5+GALE5a, -2.560
COM1>
```

			E01 E36					
			S120 S158					
			C01 C63					
			J01 J10					
			l01 l14					

RxControl: Navigation > Advanced User Settings > Channel Allocation

Use these commands to define/inquire the satellite-to-channel allocation of the receiver.

The action of the **setChannelAllocation** command is to force the allocation of a particular satellite on the set of channels identified with the *Channel* argument, thereby overruling the automatic channel allocation performed by the receiver. It is possible to allocate the same satellite to more than one channel. If you assign a satellite to a given channel, any other channel that was automatically allocated to the same satellite will be stopped and will be reallocated.

The values Gxx, Exx, Fxx, Cxx, Ixx, Jxx and Sxxx for the *Satellite* argument represent GPS, Galileo, GLONASS, BeiDou, NavIC/IRNSS, QZSS and SBAS satellites respectively. For GLONASS, the frequency number (with an offset of 8) should be provided, and not the slot number (hence the "F"). Setting the *Satellite* argument to auto brings the channel back in auto-allocation mode.

In forced allocation mode (Satellite argument different from auto), it is possible to specify the Doppler window in which the receiver will search for the satellite. This is done by setting the Search argument to manual. In that case, the Doppler and Window arguments can be provided: the receiver will search for the signal within an interval of Window Hz centred on Doppler Hz. The value to be provided in the Doppler argument is the expected Doppler at the GPS L1 carrier frequency (1575.42MHz). This value includes the geometric Doppler and the receiver and satellite frequency biases. Specifying a Doppler window can speed up the search process in some circumstances. A satellite already in tracking that falls outside of the prescribed window will remain in tracking.

If Search is set to auto, the receiver applies its usual search procedure, as it would do for auto-allocated satellites, and the Doppler and Window arguments are ignored.

Be aware that this command may disturb the normal operation of the receiver and is intended only for expert-level users.

Note that, when manually allocating a large number of channels to a single constellation, it is possible that some channels are left idle if the receiver does not have enough tracking hardware of the type required for the selected constellation.

RxControl: Navigation > Receiver Operation > Masks

Use these commands to define/inquire the carrier-to-noise ratio mask for the generation of measurements. The receiver does not generate measurements for those signals of which the C/N_0 is under the specified mask, and does not include these signals in the PVT computation. However, it continues to track these signals and to decode and use the navigation data as long as possible, regardless of the C/N_0 mask.

The mask can be set independently for each of the signal types supported by the receiver, except for the GPS P-code, of which the mask is fixed at 1 dB-Hz (this is because of the codeless tracking scheme needed for GPS P-code).

```

COM1>
```

setMultipathMitigation getMultipathMitigation	Code	Carrier				
	off	off				
	<u>on</u>	<u>on</u>				

RxControl: Navigation > Receiver Operation > Tracking and Measurements > Multipath

Use these commands to define/inquire whether multipath mitigation is enabled or not.

The arguments *Code* and *Carrier* enable or disable the A-Posteriori Multipath Estimator (APME) for the code and carrier phase measurements respectively. APME is a technique by which the receiver continuously estimates the multipath error and corrects the measurements accordingly.

This multipath estimation process slightly increases the thermal noise on the pseudoranges. However, this increase is more than compensated by the dramatic decrease of the multipath noise.

```

		+ GLONASS				
		+ GALILEO				
		+ SBAS				
		+ BEIDOU				
		+ QZSS				
		+ NAVIC				
		all				

RxControl: Navigation > Advanced User Settings > Tracking > Satellite Tracking

Use these commands to define/inquire which satellites are allowed to be tracked by the receiver. It is possible to enable or disable a single satellite (e.g. G01 for GPS PRN1), or a whole constellation. Gxx, Exx, Rxx, Cxx, Ixx, Jxx and Sxxx refer to a GPS, Galileo, GLONASS, BeiDou, NavIC/IRNSS, QZSS or SBAS satellite respectively. GLONASS satellites must be referenced by their slot number in this command.

For a satellite to be effectively tracked by the receiver, make sure that at least one of its signals is enabled in the **setSignalTracking** command.

A satellite which is disabled by this command is not considered anymore in the automatic channel allocation mechanism, but it can still be forced to a given channel, and tracked, using the **setChannelAllocation** command.

Tracking a satellite does not automatically mean that the satellite will be included in the PVT computation. The inclusion of a satellite in the PVT computation is controlled by the **setSatelliteUsage** command.

Examples

To only enable the tracking of GPS satellites, use:

```
COM1> sst, GPS <CR>
$R: sst, GPS

SatelliteTracking, G01+G02+G03+G04+G05+G06+G07+G08+G09+G10+G11
+G12+G13+G14+G15+G16+G17+G18+G19+G20+G21+G22+G23+G24+G25+G26+G27
+G28+G29+G30+G31+G32+G33+G34+G35+G36
COM1>
```

To add all SBAS satellites in the list of satellites to be tracked, use:

```
COM1> sst, +SBAS <CR>
$R: sst, +SBAS
    SatelliteTracking, G01+G02+G03+G04+G05+G06+G07+G08+G09+G10+G11
    +G12+G13+G14+G15+G16+G17+G18+G19+G20+G21+G22+G23+G24+G25+G26+G27
    ...
COM1>
```

To remove SBAS PRN120 from the list of allowed satellites, use:

COM1> sst, -S120 <CR>
\$R: sst, -S120
 SatelliteTracking, G01+G02+G03+G04+G05+G06+G07+G08+G09+G10+G11
 +G12+G13+G14+G15+G16+G17+G18+G19+G20+G21+G22+G23+G24+G25+G26+G27

RxControl: Navigation > Receiver Operation > Masks

This advanced command can be used to override the health flags for selected GNSS signals. This feature is mainly intended for experimental use: ignoring the health flags may lead to unpredictable results.

By default, the receiver discards GNSS signals for which the health flag is set to "unhealthy" in the navigation message. This command instructs the receiver to ignore the health flags for the specified set of signals. The health flags can be ignored for the measurement generation only, or for both the measurement generation and the PVT computation.

If a signal is listed in the *Measurements* argument, measurements (pseudoranges, carrier phases, ...) are produced for that signal regardless of its health flag. These measurements become available in all output formats (SBF, RINEX, RTCM, ...). This applies to all satellites transmitting that signal.

If a signal is listed in both the *Measurements* and the *PVT* arguments, measurements from that signal are allowed to be used in PVT engine, regardless of their health status. This applies to all PVT modes (standalone, RTK, ...).

The signals in the following table do not transmit a health flag or the receiver does not decode it. For those signals, the health status is taken from a different signal, as indicated in the table.

Signal	Health flag source
GALE5	GALE5a and GALE5b
GALE6BC	GALE1BC
GPSL1PY	GPSL1CA
GPSL2PY	GPSL1CA
GLOL2P	GLOL2CA
GLOL3	GLOL1CA

The GPS L5 signal is handled a bit differently. When overriding the health flag for GPS L5, measurements from that signal are produced or used in the PVT engine if the L1CA signal of the corresponding satellite is flagged as healthy.

Note that health flags are assumed "healthy" if unknown or if not received yet.

Example

COM1> snho, GPSL5, GPSL5
\$R: snho, GPSL5, GPSL5
SignalHealthOverride, GPSL5, GPSL5
COM1>

		+ SBAS				
		+ BEIDOU				
		+ QZSS				
		+ NAVIC				
		all				

RxControl: Navigation > Advanced User Settings > Tracking > Signal Tracking

Use these commands to define/inquire which signals are allowed to be tracked by the receiver. The signals can be addressed individually, or all signals from a constellation can be addressed at once. For example, GALILEO is an alias for all Galileo signals.

Note that some signals can only be enabled together with other signals:

- enabling GPSL1PY has no effect unless GPSL1CA and GPSL2PY are enabled as well;
- enabling GPSL2PY has no effect unless GPSL1CA is enabled as well;
- enabling GLOL2P has no effect unless GLOL2CA is enabled as well;
- enabling GLOL3 has no effect unless GLOL1CA is enabled as well;

Invoking this command causes all tracking loops to stop and restart.

Example

To configure the receiver in dual-frequency GPS L1CA+L2C mode, use:

COM1> snt, GPSL1CA+GPSL2C <CR>
\$R: snt, GPSL1CA+GPSL2C
 SignalTracking, GPSL1CA+GPSL2C
COM1>

		all					

RxControl: Navigation > Receiver Operation > Tracking and Measurements > Smoothing

Use these commands to define/inquire the code measurement smoothing interval.

The *Interval* argument defines the length of the smoothing filter that is used to smooth the code measurements by the carrier phase measurements. It is possible to define a different interval for each signal type. If *Interval* is set to 0, the code measurements are not smoothed. The smoothing interval can vary from 1 to 1000 seconds.

To prevent transient effect from perturbing the smoothing filter, smoothing is disabled during the first ten seconds of tracking, i.e. when the lock time is lower than 10s. Likewise, the smoothing effectively starts with a delay of 10 seconds after entering the **setSmoothingInterval** command.

Code smoothing allows reducing the pseudoranges noise and multipath. It has no influence on the carrier phase and Doppler measurements. The smoothing filter has an incremental effect; the noise of the filtered pseudoranges will decrease over time and reach its minimum after *Interval* seconds. For some applications, it may be necessary to wait until this transient effect is over before including the measurement in the PVT computation. This is the purpose of the *Alignment* argument. If *Alignment* is not set to 0, measurements taken during the first *Alignment*+10 seconds of tracking will be discarded. The effective amount of *Alignment* is never larger than *Interval*, even if the user sets it to a larger value.

RxControl: Navigation > Advanced User Settings > Tracking > Tracking Loop Parameters

Use these commands to define/inquire the tracking loop parameters for each individual signal type.

The DLLBandwidth and PLLBandwidth arguments define the single-sided DLL and PLL noise bandwidth, in Hz.

The MaxTpDLL argument defines the maximum DLL pre-detection time, in millisecond. The actual pre-detection time applied by the receiver (*TpDLL*) depends on the presence of a pilot component. For signals having a pilot component (e.g. GPS L2C), TpDLL = MaxTpDLL. For signals without pilot component (e.g. GPS L1CA), TpDLL is the largest divider of the symbol duration smaller than or equal to MaxTpDLL.

The MaxTpPLL argument defines the maximal PLL pre-detection time, in millisecond. The actual pre-detection time in the receiver (TpPLL) is computed in the same way as indicated for the *MaxTpDLL* argument.

Setting the Adaptive argument to on allows the receiver to dynamically change the loop parameters in order to optimize performance in specific conditions.

After entering this command, all active tracking loops stop and restart with the new settings.

This command should only be used by expert users who understand the consequences of modifying the default values, as changing the tracking parameters may degrade the tracking performances. When using non-default MaxTpDLL or MaxTpPLL values, it is recommended to use a multiple or a divider of the symbol duration. It is further recommended that the product of *TpPLL* (in milliseconds) and *PLLBandwidth* (in Hz) be kept between 100 and 200.

Beware that decreasing the pre-detection times may significantly increase the load on the processor.

```

3.2.5 Frontend and Interference Mitigation

sam	setAGCMode	Band	Mode	Gain			
gam	getAGCMode	Band					
		+ L1	<u>auto</u>	0 <u>35</u> 70 dB			
		+ B3E6	frozen				
		+ L2	manual				
		+ L5					
		+ LBand					
		all					

RxControl: Navigation > Advanced User Settings > Frontend and Interference Mitigation > Frontend Settings

Use these commands to define/inquire the operation mode of the Automatic Gain Control (AGC) in the receiver frontend. The AGC is responsible for amplifying the input RF signal to an appropriate level.

By default (*Mode* is set to auto), the AGC automatically adjusts its gain in function of the input signal power. In frozen mode, the AGC gain is kept constant at its current value (after a ten-second stabilisation period) and does not follow any subsequent variation of the input signal power. In manual mode, the user can set the gain to a fixed value specified by the *Gain* argument. The *Gain* argument is ignored in auto and frozen modes.

The first argument (*Band*) specifies for which frequency band the settings apply.

```
COM1> sam, all, manual, 30<CR>
$R: sam, all, manual, 30
  AGCMode, all, manual, 30
COM1>
```

setBBSamplingMode getBBSamplingMode	Mode				
	BeforeIM AfterIM				

RxControl: Navigation > Advanced User Settings > Frontend and Interference Mitigation > Frontend Settings

Use this command to configure the baseband samples (ADC samples) logged in the ${\tt BBSamples}$ SBF block.

The following sampling modes are defined:

Mode	Description
BeforeIM	The samples in the BBSamples SBF block are taken before interference mitigation. All frequency bands are sampled in turn.
AfterIM	The samples in the BBSamples SBF block are taken after interference mitigation. All frequency bands are sampled in turn.

Example

COM1> sbbs, BeforeIM<CR>

\$R: sbbs, BeforeIM

BBSamplingMode, BeforeIM

COM1>

snf	setNotchFiltering	Notch	Mode	CenterFreq	Bandwidth			
gnf	getNotchFiltering	Notch						
		+ Notch1	<u>auto</u>	1100.000	<u>30</u> 1600 kHz			
		+ Notch2		1700.000 MHz				
		+ Notch3	manual	IVII IZ				
		all						

RxControl: Navigation > Advanced User Settings > Frontend and Interference Mitigation > Frontend Settings

Use these commands to set the position of the notch filter(s) in the receiver's frontend. Notch filters are used to cancel narrowband interferences.

The *Mode* argument is used to enable or disable the notch filter specified in the first argument. When set to auto, the receiver performs automatic detection of the region of the spectrum affected by interference if any. In manual mode, the user forces a certain region of the spectrum to be blanked by the notch filter. That region must be specified by the arguments *CenterFreq* and *Bandwidth*. *Bandwidth* is the double-sided bandwidth centered at *CenterFreq*. Specifying a region outside of a GNSS band has no effect.

In some cases, changing the operating mode of the notch filters (i.e. modifying the *Mode* argument) can cause the tracking loops to reset.

```
COM1> snf, Notch1, manual, 1227.0, 30<CR>
$R: snf, Notch1, manual, 1227.0, 30
  NotchFiltering, Notch1, manual, 1227.000, 30
COM1>
```

setWBIMitigation getWBIMitigation	Mode				
	off on				

RxControl: Navigation > Advanced User Settings > Frontend and Interference Mitigation > Frontend Settings

Use this command to enable or disable the mitigation of wideband interferences, including swept-frequency or pulsed interferences. When enabled (argument *Mode* set to on), the interference mitigation is done automatically and can be monitored with the RFStatus SBF block.

Invoking this command causes all tracking loops to stop and restart.

Example

COM1> swbi, on<CR>
\$R: swbi, on
 WBIMitigation, on
COM1>

3.2.6 Navigation Filter

sao	setAntennaOffset	Antenna	DeltaE	DeltaN	DeltaU	Туре (20)	SerialNr (20)	SetupID	
gao	getAntennaOffset	Antenna							
		+ Main all	1000.0000	1000.0000	-1000.0000 <u>0.0000</u> 1000.0000 m	<u>Unknown</u>	<u>Unknown</u>	<u>0</u> 255	

RxControl: Navigation > Receiver Setup > Antennas

Use these commands to define/inquire the parameters that are associated with the antenna connected to your receiver.

The arguments *DeltaE*, *DeltaN* and *DeltaU* are the offsets of the antenna reference point (ARP, see section 2.5) with respect to the marker, in the East, North and Up (ENU) directions respectively, expressed in meters. All absolute positions reported by the receiver are marker positions, obtained by subtracting this offset from the ARP. The purpose is to take into account the fact that the antenna may not be located directly on the surveying point of interest.

Use the argument *Type* to specify the type of your antenna. For best positional accuracy, it is recommended to select a type from the list returned by the command <code>lstAntennaInfo</code>, <code>Overview</code>. This is the list of antennas for which the receiver can compensate for phase center variation (see section 2.5). If *Type* does not match any entry in the list returned by <code>lstAntennaInfo</code>, <code>Overview</code>, the receiver will assume that the phase center variation is zero at all elevations and frequency bands, and the position will not be as accurate. If the antenna name contains whitespaces, it has to be enclosed between double quotes. For proper name matching, it is important to keep the exact same number of whitespaces and the same case as the name returned by <code>lstAntennaInfo</code>, <code>Overview</code>.

The argument *SerialNr* is the serial number of your particular antenna. It may contain letters as well as digits (do not forget to enclose the string between double quotes if it contains whitespaces).

The argument *SetupID* is the antenna setup ID as defined in the RTCM standard. It is a parameter for use by the service provider to indicate the particular reference station-antenna combination. The number should be increased whenever a change occurs at the station that affects the antenna phase center variations. Setting *SetupID* to zero means that the values of a standard model type calibration should be used. The value entered for this argument is used to set the setup ID field in the message type 23 of RTCM2.3, and in message types 1007, 1008 and 1033 of RTCM3. It has otherwise no effect on the receiver operation.

```
COM1> sao, Main, 0.1, 0.0, 1.3, "AERAT2775_159 SPKE", 5684, 0<CR>
$R: sao, Main, 0.1, 0.0, 1.3, "AERAT2775_159 SPKE", 5684, 0
AntennaOffset, Main, 0.1000, 0.0000, 1.3000, "AERAT2775_159
SPKE", 5684, 0
COM1>
```

sdca	setDiffCorrMaxAge	DGNSSCorr	RTKCorr	PPPCorr	Iono			
gdca	getDiffCorrMaxAge							
		0.0 <u>400.0</u> 3600.0 s		0.0 <u>1200.0</u> 3600.0 s	0.0 <u>600.0</u> 3600.0 s			

RxControl: Navigation > Positioning Mode > PPP and Differential Corrections

Use these commands to define/inquire the maximum age acceptable for a given differential correction type. A correction is applied only if its age (aka latency) is under the timeout specified with this command and if it is also under the timeout specified with the <code>MaxAge</code> argument of the <code>setDiffCorrUsage</code> command. In other words, the command <code>setDiffCorrUsage</code> sets a global maximum timeout value, while the command <code>setDiffCorrMaxAge</code> can force shorter timeout values for certain correction types.

The argument *DGNSSCorr* defines the timeout of the range corrections when the PVT is computed in DGNSS mode.

The argument *RTKCorr* defines the timeout of the base station code and carrier phase measurements when the PVT is computed in RTK mode.

The argument *PPPCorr* defines the timeout of the wide-area satellite clock and orbit corrections used in PPP mode (only applicable if your receiver supports PPP positioning mode).

The argument *lono* defines the timeout of the ionospheric corrections (such as transmitted in RTCM2.x MT15) used in DGNSS PVT mode.

If the timeout is set to 0, the receiver will never apply the corresponding correction.

Note that this command does not apply to the corrections transmitted by SBAS satellites. For these corrections, the receiver always applies the timeout values prescribed in the DO229 standard.

```
COM1> sdca, 10 <CR>
$R: sdca, 10
   DiffCorrMaxAge, 10.0, 20.0, 300.0, 300.0
COM1>
```

sdcu	setDiffCorrUsage	Mode	MaxAge	BaseSelection	BaseID	MovingBase	MaxBase	MaxBaseline	
gdcu	getDiffCorrUsage								
		LowLatency	0.1 <u>3600.0</u> s	<u>auto</u>	<u>0</u> 4095	off	<u>1</u> 10	0 <u>2500000</u> m	
				manual		on			

RxControl: Navigation > Positioning Mode > PPP and Differential Corrections

Use these commands to define/inquire the usage of incoming differential corrections in DGNSS or RTK rover mode.

The *Mode* argument defines the type of differential solution that will be computed by the receiver. If LowLatency is selected, the PVT is computed at the moment local measurements of the receiver are available and the most recently received differential corrections are extrapolated to the current time.

The MaxAge argument defines the maximum age of the differential corrections to be considered valid. MaxAge applies to all types of corrections (DGNSS, RTK, satellite orbit, etc), except for those received from a SBAS satellite. See also the command **setDiffCorrMaxAge** to set different maximum ages for different correction types.

The BaseSelection argument defines how the receiver should select the base station(s) to be used. If auto is selected and the receiver is in DGNSS-rover mode, it will use all available base stations. If auto is selected and the receiver is in RTK-rover mode, it will automatically select the nearest base station. If manual is selected, the receiver will only use the corrections from the base station defined by the BaseID argument (in both DGNSS and RTK modes).

The MovingBase argument defines whether the base station is static or moving.

MaxBase sets the maximum number of base stations to include in the PVT solution.

MaxBaseline sets the maximum baseline length: base stations located beyond the maximum baseline length are excluded from the PVT solution.

```

sem	setElevationMask	Engine	Mask				
gem	getElevationMask	Engine					
		+ Tracking	-90 <u>0</u> 90 deg				
		+ PVT					
		all					

RxControl: Navigation > Receiver Operation > Masks

Use these commands to set or get the elevation mask in degrees. There are two masks defined: a tracking mask and a PVT mask.

Satellites under the tracking elevation mask are not tracked, and therefore there is no measurement, nor navigation data available from them. The tracking elevation mask does not apply to SBAS satellites: SBAS satellites are generally used to supply corrections and it is undesirable to make the availability of SBAS corrections dependent on the satellite elevation. The tracking elevation mask does not apply to satellites that are manually assigned with the **setChannelAllocation** command.

Satellites under the PVT mask are excluded from the PVT computation. Note that it does not imply that all satellites above the mask are included: in addition to the elevation mask, satellites must pass internal sanity checks to be effectively included in the PVT.

Although possible, it does not make sense to select a higher elevation mask for the tracking than for the PVT, as, obviously, a satellite which is not tracked cannot be included in the PVT.

The mask can be negative to allow the receiver to track satellites below the horizon. This can happen in case the receiver is located at high altitudes or if the signal is refracted through the atmosphere.

```
COM1> sem, Tracking, 15<CR>
$R: sem, Tracking, 15
    ElevationMask, Tracking, 15
COM1>
```

sgu	setGeoidUndulation	Mode	Undulation				
ggu	getGeoidUndulation						
		auto manual	-250.000 <u>0.000</u> 250.000 m				

RxControl: Navigation > Receiver Operation > Position > Earth Models

Use these commands to define/inquire the geoid undulation at the receiver position. The geoid undulation specifies the local difference between the geoid and the WGS84 ellipsoid.

If *Mode* is set to auto, the receiver computes the geoid undulation with respect to the WGS84 ellipsoid using the model defined in 'Technical Characteristics of the NAVSTAR GPS, NATO, June 1991', regardless of the datum specified with the **setGeodeticDatum** command. In auto mode, the *Undulation* argument is ignored.

The geoid undulation is included in the PVTCartesian and the PVTGeodetic SBF blocks and in the NMEA position messages.

```

sim	setlonosphereModel	Model				
gim	getlonosphereModel					
		<u>auto</u>				
		off				
		KlobucharGPS				
		SBAS				
		MultiFreq				
		KlobucharBDS				

RxControl: Navigation > Receiver Operation > Position > Atmosphere

Use these commands to define/inquire the type of model used to correct ionospheric errors in the PVT computation. The following models are available:

Model	Description
auto	With this selection, the receiver will, based on the available information, automatically select the best model on a satellite to satellite basis.
off	The receiver will not correct measurements for the ionospheric delay. This may be desirable if the receiver is connected to a GNSS signal simulator.
KlobucharGPS	This model uses the parameters as transmitted by the GPS satellites to compute the ionospheric delays.
SBAS	This model complies with the DO229 standard: it uses the near real-time ionospheric delays transmitted by the SBAS satellites in MT18 and MT26. If no such message has been received, the Klobuchar model is selected automatically.
MultiFreq	This model uses a combination of measurements on different carriers to accurately estimate ionospheric delays. It requires the availability of at least dual-frequency measurements.
KlobucharBDS	This model uses the parameters as transmitted by the BeiDou satellites to compute the ionospheric delays.

Unless the model is set to \mathtt{auto} , the receiver uses the same model for all satellites, e.g. if the $\mathtt{Klobuchar}$ model is requested, the Klobuchar parameters transmitted by GPS satellites are used for all tracked satellites, regardless of their constellation.

If not enough data is available to apply the prescribed model to a given satellite (for instance if only single-frequency measurements are available and the model is set to MultiFreq), the satellite in question will be discarded from the PVT. Under most circumstances, it is recommended to leave the model to auto.

Examples

To disable the compensation for ionospheric delays, use:

COM1> sim, off <CR>
\$R: sim, off
 IonosphereModel, off
COM1>

COM1> gim <CR>
\$R: gim
 IonosphereModel, off
COM1>

setMagneticVariance getMagneticVariance	Mode	Variation				
	auto manual	-180.0 <u>0.0</u> 180.0 deg				

RxControl: Navigation > Receiver Operation > Position > Earth Models

Use these commands to define the magnetic variation (a.k.a. magnetic declination) at the current position. The magnetic variation specifies the local offset of the direction to the magnetic north with respect to the geographic north. The variation is positive when the magnetic north is east of the geographic north.

By default (the argument *Mode* is set to auto), the receiver automatically computes the variation according to the 12th generation of the International Geomagnetic Reference Field (IGRF) model, using the IGRF2015 coefficients corrected for the secular variation.

Note that the magnetic variation is used solely in the generation of NMEA messages.

```
COM1> smv, manual, 1.1 <CR>
$R: smv, manual, 1.1
  MagneticVariance, manual, 1.1
COM1>

COM1> gmv <CR>
$R: gmv
  MagneticVariance, manual, 1.1
COM1>
```

snrc	setNetworkRTKConfig	NetworkType				
gnrc	getNetworkRTKConfig					
		<u>auto</u>				
		VRS				

RxControl: Navigation > Positioning Mode > PPP and Differential Corrections

Use these commands to define/inquire the type of the RTK network providing the differential corrections.

In most cases, it is recommended to leave the Type argument to auto to let the receiver autodetect the network type. For some types of VRS networks (especially for those having long baselines between the base stations), optimal performance is obtained by forcing the type to VRS.

Example

COM1> snrc, VRS <CR>
\$R: snrc, VRS
 NetworkRTKConfig, VRS
COM1>

spm	setPVTMode	Mode	RoverMode	RefPos			
gpm	getPVTMode						
		Static	+ StandAlone	<u>auto</u>			
		Rover	+ SBAS	Geodetic1			
			+ DGNSS	Geodetic2			
			+ RTKFloat	Geodetic3			
			+ RTKFixed	Geodetic4			
			+RTK	Geodetic5			
			all	Cartesian1			
				Cartesian2			
				Cartesian3			
				Cartesian4			
				Cartesian5			

RxControl: Navigation > Positioning Mode > PVT Mode

Use these commands to define/inquire the main PVT mode of the receiver. The argument *Mode* specifies the general positioning mode. If Rover is selected, the receiver assumes that it is moving and it computes the best PVT allowed by the *RoverMode* argument. If Static is selected, the receiver assumes that it is static and it reports a constant position. The static position can be specified by the user or computed by the receiver, according to the settings of the *RefPos* argument.

The argument *RoverMode* specifies the allowed PVT modes when the receiver is operating in Rover mode. Different modes can combined with the "+" operator. Refer to section 2.4 for a description of the PVT modes. The value RTK is an alias for RTKFloat+RTKFixed. When more than one mode is enabled in *RoverMode*, the receiver automatically selects the mode that provides the most accurate solution with the available data.

The *RefPos* argument defines the reference position of the antenna ARP. This is the position that is encoded in the RINEX header (after application of the marker-ARP offset specified with the **setAntennaOffset** command) and in the relevant RTCM and CMR differential correction messages.

If *RefPos* is set to Geodetic*i* or Cartesian*i*, the fixed ARP coordinates must be provided by the user with the **setStaticPosCartesian** or the **setStaticPosGeodetic** commands.

If *RefPos* is set to auto, the reference ARP position is computed by the receiver. In rover mode, the reference position is not fixed. This is the setting that must be used on moving platforms.

Examples

```
COM1> spm, Rover, StandAlone+RTK <CR>
$R: spm, Rover, StandAlone+RTK
   PVTMode, Rover, StandAlone+RTK, auto
COM1>
```

To set up a fixed base station at a known location, use the following:

```
COM1> sspg, Geodetic1, 50.5209, 4.4245, 113.3 <CR>
$R: sspg, Geodetic1, 50.5209, 4.4245, 113.3
   StaticPosGeodetic, Geodetic1, 50.52090000, 4.42450000, 113.3000
COM1> spm, Static, , Geodetic1 <CR>
$R: spm, Static, , Geodetic1
   PVTMode, Static, StandAlone+RTK, Geodetic1
```

COM1>

srl	setRAIMLevels	Mode	Pfa	Pmd	Reliability			
grl	getRAIMLevels							
		off	-12 <u>-4</u> 1	-12 <u>-4</u> 1	-12 <u>-3</u> 1			
		<u>on</u>						
		Mode1						

RxControl: Navigation > Receiver Operation > Position > Integrity

Use these commands to define/inquire the parameters of the Receiver Autonomous Integrity Monitoring (RAIM) algorithm in rover PVT mode.

The *Mode* argument acts as an on/off switch: it determines whether RAIM is active or not.

The *Pfa* argument sets the probability of false alarm of the w-test used in the "identification" step of the RAIM algorithm. Increasing this parameter increases the integrity but may reduce the availability of the positional solution.

The *Pmd* argument sets the probability of missed detection, which the receiver uses to compute the Minimal Detectable Bias and hence the XERL values.

The *Reliability* argument sets the probability of false alarm of the Overall Model test used in the "detection" step of the RAIM algorithm.

The value to be provided in the *Pfa*, *Pmd* and *Reliability* arguments are the base-10 logarithms of the desired probabilities. For instance, if you want a probability of false alarm of 1e-6, you have to set the *Pfa* argument to -6.

Note that this command has no effect when the receiver is configured in static PVT mode with the **setPVTMode**, **Static** command. In static PVT mode, the RAIM algorithm uses fixed parameters that cannot be changed by the user.

Examples

To configure the receiver outlier detection with a probability of 1e-4 (0.01%) that a false alarm will be raised (type I error), a probability of 1e-4 (0.01%) that an outlier will be missed (type II error) and an Overall Model probability of false alarm of 1e-6 (0.0001%), use:

```
COM1> srl, on, -4, -4, -6 <CR>
$R: srl, on, -4, -4, -6

RAIMLevels, on, -4, -4, -6

COM1>
```

To disable the outlier detection, use:

```
COM1> srl, off <CR>
$R: srl, off
   RAIMLevels, off, -4, -4, -6
COM1>
```

srd	setReceiverDynamics	Level	Motion				
grd	getReceiverDynamics						
		Max	Static				
		High	Quasistatic				
		<u>Moderate</u>	Pedestrian				
		Low	<u>Automotive</u>				
			RaceCar				
			HeavyMachinery				
			UAV				
			Unlimited				

RxControl: Navigation > Receiver Operation > Position > Motion

Use these commands to set the type of dynamics the GNSS antenna is subjected to.

The *Level* argument sets the balance between noise and dynamics in the GNSS measurements and the PVT solution. If rapid displacements (such as those caused by shocks, drops, and oscillations) need to be detected, the *Level* argument can be set to High. In that case, high-frequency motion becomes visible at the expense of an increase in the noise. Conversely, if noise reduction is important, the *Level* argument can be set to Low. It is generally recommended to keep the default value (Moderate), where the receiver will sense the dynamics and adapt itself accordingly. The Max level is a special setting, for which the navigation filter is disabled and the receiver computes epoch-by-epoch independent PVT solutions. Note that the Max level can lead to a longer latency of the PVT output.

The *Motion* argument defines the general characteristics of the receiver motion, such as the expected speed, rotation, and vibration level. This can help the receiver to optimize certain parameters for your application.

Motion	Description
Static	Fixed base and reference stations.
Quasistatic	Low speed, limited area motion typical of surveying applications.
Pedestrian	Low speed (<7m/s) motion. E.g. pedestrians, low-speed land vehicles,
Automotive	Medium speed (<50m/s) motion. E.g. passenger cars, rail vehicles. This setting is generally adequate for most applications.
RaceCar	High speed terrestrial vehicle. E.g. race cars,
HeavyMachinery	Construction equipment, tractors,
UAV	Unmanned Aerial Vehicle.
Unlimited	Unconstrained motion.

Example

COM1> srd, High, Automotive<CR>

		+ NAVIC	+ NAVIC				
		all	all				

RxControl: Navigation > Receiver Operation > Masks

This advanced command can be used to override the health flags for selected satellites. This feature is mainly intended for experimental use: ignoring the health flags may lead to unpredictable results.

By default, the receiver discards GNSS signals for which the health flag is set to "unhealthy" in the navigation message. This command instructs the receiver to ignore the health flags for the specified set of satellites. The health flags can be ignored for the measurement generation only, or for both the measurement generation and the PVT computation.

If a satellite is listed in the *Measurements* argument, measurements (pseudoranges, carrier phases, ...) are produced for all signals of that satellite regardless of their health flag. These measurements become available in all output formats (SBF, RINEX, RTCM, ...).

If a satellite is listed in both the *Measurements* and the *PVT* arguments, measurements from all its signals are allowed to be used in PVT engine, regardless of their health status. This applies to all PVT modes (standalone, RTK, ...).

Some signals do not transmit a health flag, or the receiver does not decode it. For those signals, the health status is taken from a different signal. See the description of **setSignalHealthOverride** for details.

Note that health flags are assumed "healthy" if unknown or if not received yet, except for GPS satellites G33 to G36. Those satellites are considered experimental and assumed unhealthy by default.

```
COM1> ssho, E14+E18, E14+E18
$R: ssho, E14+E18, E14+E18
SatelliteHealthOverride, E14+E18, E14+E18

		+ GLONASS				
		+ GALILEO				
		+ SBAS				
		+ BEIDOU				
		+ QZSS				
		all				

RxControl: Navigation > Advanced User Settings > PVT > Satellite Usage

Use these commands to define/inquire which satellites are allowed to be included in the PVT computation. It is possible to enable or disable a single satellite (e.g. G01 for GPS PRN1), or a whole constellation. Gxx, Exx, Cxx, Sxxx and Rxx refer to a GPS, Galileo, BeiDou, SBAS and GLONASS satellite respectively. GLONASS satellites must be referenced by their slot number in this command.

Note that this command only allows the usage of the selected satellites in the PVT. It does not mean that the PVT will effectively use all of them: the PVT engine may only use a subset of the allowed satellites depending on its internal quality checks.

Examples

To only use GPS measurements in the PVT computation, use:

```
COM1> ssu, GPS <CR>
$R: ssu, GPS
    SatelliteUsage, G01+G02+G03+G04+G05+G06+G07+G08+G09+G10+G11
    +G12+G13+G14+G15+G16+G17+G18+G19+G20+G21+G22+G23+G24+G25+G26
    +G27+G28+G29+G30+G31+G32
COM1>
```

To exclude the G03 measurements from the PVT, use:

```
COM1> ssu, -G03 <CR>
$R: ssu, -G03
    SatelliteUsage, G01+G02+G04+G05+G06+G07+G08+G09+G10+G11+G12
    +G13+G14+G15+G16+G17+G18+G19+G20+G21+G22+G23+G24+G25+G26+G27
    ...
CM1>
```

ssbc	setSBASCorrections	Satellite	SISMode	NavMode	DO229Version			
gsbc	getSBASCorrections							
		<u>auto</u>	Test	EnRoute	<u>auto</u>			
		EGNOS	Operational	PrecApp	DO229C			
		WAAS		MixedSystems				
		MSAS						
		GAGAN						
		SDCM						
		S120 S158						

RxControl: Navigation > Positioning Mode > SBAS Corrections

Use these commands to define/inquire the details on the usage of SBAS data in the PVT computation. This command does not define whether SBAS corrections are to be used or not in the PVT (this is done by the **setPVTMode** command), but it specifies how these corrections should be used.

The Satellite argument defines the provider of SBAS corrections, being either an individual satellite or a satellite system. If EGNOS, WAAS, MSAS, GAGAN or SDCM is selected, the receiver restricts the automatic selection of a satellite to those that are part of the EGNOS, WAAS, MSAS, GAGAN or SDCM system. When auto is selected for the Satellite argument, the receiver will automatically select a satellite on the basis of the location of the receiver and on the availability of SBAS corrections.

The *SISMode* argument defines the interpretation of a "Do Not Use for Safety Applications" message.

When set to <code>Operational</code>, the receiver will discard all SBAS corrections received from a satellite upon reception of a MT00 from that satellite. Note that MT02 content encoded in a MT00 message will be interpreted by the receiver as a MT02 message: only MT00 with all '0' symbols will be interpreted as a true "Do Not Use for Safety Applications". When the argument <code>SISMode</code> is set to <code>Test</code>, the receiver will ignore the reception of a "Do Not Use for Safety Applications" message. This provides the possibility to use a signal from a SBAS system in test mode.

The SBAS standards, which have their origin in aviation, make a distinction between two positioning applications: en-route and precision approach. The choice between both applications influences the length of the interval during which the SBAS corrections are valid. During a precision approach the validity of the data is much shorter. The receiver can operate in both modes, which is controlled by the *NavMode* argument.

In EnRoute or in PrecApp mode, the receiver only uses the satellite systems for which SBAS corrections are available. For best positioning accuracy, it is typically preferable to include all satellites in the position computation, even if they are not corrected by SBAS. This is achieved by the MixedSystems mode.

The *DO229Version* argument can be used to specify which version of the DO 229 standard to conform to.

Example

To force the receiver to use corrections from PRN 122 and ignore message MT00:

COM1> ssbc, S122, Test <CR>
\$R: ssbc, S122, Test
SBASCorrections, S122, Test, MixedSystems, auto

COM1>

estm e	exeSetTime	Format	TimeSpec (40)				
gstm	getSetTime						
		<u>DateTime</u>					

RxControl: Navigation > Receiver Initialization > Set Trusted Time

Use this command to provide the receiver with the current time from an external non-GNSS source. It allows the receiver to compare its own time, obtained from the GNSS satellites, with the time provided in the *TimeSpec* argument. In case of mismatch, the GNSS signals are considered non-authentic. The time must be provided in the GPS/Galileo time scale, which, in 2025, was running 18 seconds ahead of UTC. It must be accurate to a few seconds.

Entering this command is fully optional, except when Galileo OSNMA authentication is enabled in strict mode (see the **setGalOSNMAUsage** command) and connecting to an NTP server is not possible.

Note that this command has no effect on the receiver time keeping described in section 2.3. In particular, it cannot be used to set the receiver time. It is only used to provide a trusted external time stamp, allowing the receiver to validate the time it retrieved from the GNSS satellites.

It is not necessary to enter this command at regular intervals. A single call is enough as the receiver keeps track of the elapsed time since the command was entered.

```

RxControl: Navigation > Advanced User Settings > PVT > Signal Usage

Use these commands to define/inquire which signal types are used by the receiver.

The *PVT* argument lists the signals that can be used by the PVT. Removing a signal from the list will disable the usage of the corresponding range, phase & Doppler measurements in the PVT computation. Note that enabling a signal does not force the PVT to use it; it only means that the PVT is allowed to use it.

The NavData argument lists the signals for which the receiver is allowed to decode the navigation message. Removing a signal from the list will disable further decoding of the corresponding navigation data (ephemeris, ionosphere parameters ...). Beware that data decoded in the past will still be used. Past data can be erased with the exeResetReceiver, hard, SatData+PVTData command.

Example

To force the receiver to only use the L1 GPS C/A measurements and navigation information in the PVT solution, use:

COM1> snu, GPSL1CA, GPSL1CA <CR>
\$R: snu, GPSL1CA, GPSL1CA
 SignalUsage, GPSL1CA, GPSL1CA
COM1>

						Other		

RxControl: Navigation > Positioning Mode > PVT Mode

Use these commands to define/inquire a set of Cartesian coordinates. This command should be used in conjunction with the **setPVTMode** command to specify a reference position. The Cartesian coordinates in the *X*, *Y* and *Z* arguments must refer to the antenna reference point (ARP), and not to the marker.

The argument *Datum* specifies the datum to which the coordinates refer. When the PVT engine is in static mode (**setPVTMode**, **Static** command), the specified datum is reflected in the <code>Datum</code> field of the position-related SBF blocks (e.g. <code>PVTCartesian</code>). Note that the receiver does not apply any datum transformation to the *X*, *Y* and *Z* coordinates. In particular, the coordinates are encoded without change into the relevant differential correction messages.

Datum	Description
WGS84	WGS84 or ITRFxx (the receiver does not make a distinction between them)
ETRS89	European ETRS89 (ETRF2000 realization)
NAD83	NAD83(2011), North American Datum (2011)
NAD83_PA	NAD83(PA11), North American Datum, Pacific plate (2011)
NAD83_MA	NAD83(MA11), North American Datum, Marianas plate (2011)
GDA94	GDA94(2010), Geocentric Datum of Australia (2010)
GDA2020	GDA2020, Geocentric Datum of Australia 2020
User1	First user-defined datum. The corresponding ellipsoid must be defined with the setUserEllipsoid command.
User2	Second user-defined datum
Other	Datum not in the list or unknown

Example

To set up a static base station in Cartesian coordinates:

sspg	setStaticPosGeodetic	Position	Latitude	Longitude	Altitude	Datum		
gspg	getStaticPosGeodetic	Position						
		+ Geodetic1	-90.000000000			WGS84		
		+ Geodetic2		<u>0.000000000</u> <u>0.0000</u> mETR	<u>0.0000</u>	ETRS89		
		+ Geodetic3		deg		NAD83		
		+ Geodetic4				NAD83_PA		
		+ Geodetic5				NAD83_MA		
		all				GDA94		
						GDA2020		
						User1		
						User2		
						Other		

RxControl: Navigation > Positioning Mode > PVT Mode

Use these commands to define/inquire a set of geodetic coordinates. This command should be used in conjunction with the **setPVTMode** command to specify a reference position. The geodetic coordinates in the *Latitude*, *Longitude* and *Altitude* arguments must refer to the antenna reference point (ARP), and not to the marker.

The argument *Datum* specifies the datum to which the coordinates refer. See the **setStaticPosCartesian** command for a short description of the supported datums.

Example

To set up a static base station in geodetic coordinates:

stm	setTroposphereModel	ZenithModel	MappingModel				
gtm	getTroposphereModel						
		off	Niell				
		Saastamoinen	MOPS				
		MOPS					

RxControl: Navigation > Receiver Operation > Position > Atmosphere

Use these commands to define/inquire the type of model used to correct tropospheric errors in the PVT computation.

The *ZenithModel* parameter indicates which model the receiver uses to compute the dry and wet delays for radio signals at 90 degree elevation. The modelled zenith tropospheric delay depends on assumptions for the local air total pressure, the water vapour pressure and the mean temperature. The following zenith models are defined:

ZenithModel	Description
off	The measurements will not be corrected for the troposphere de- lay. This may be desirable if the receiver is connected to a GNSS signal simulator.
Saastamoinen	Saastamoinen, J. (1973). "Contributions to the theory of atmospheric refraction". In three parts. Bulletin Geodesique, No 105, pp. 279-298; No 106, pp. 383-397; No. 107, pp. 13-34.
MOPS	Minimum Operational Performance Standards for Global Positioning/Wide Area Augmentation System Airborne Equipment RTCA/DO-229C, November 28, 2001.

The Saastamoinen model uses user-provided values of air temperature, total air pressure referenced to the Mean Sea Level and relative humidity (see **setTroposphereParameters** command) and estimates actual values adjusted to the receiver height.

The MOPS model neglects the user-provided values and instead assumes a seasonal model for all the climatic parameters. Local tropospheric conditions are estimated based on the coordinates and time of the year.

The use of the Saastamoinen model can be recommended if external information on temperature, pressure, humidity is available. Otherwise it is advisable to rely on climate models.

The zenith delay is mapped to the current elevation for each satellite using the requested *MappingModel*. The following mapping models are defined:

MappingModel	Description
Niell	Niell, A.E. (1996). Global Mapping Functions for the atmosphere delay at radio wavelengths, Journal of Geophysical Research, Vol. 101, No. B2, pp. 3227-3246.
MOPS	Minimum Operational Performance Standards for Global Positioning/Wide Area Augmentation System Airborne Equipment RTCA/DO-229C, November 28, 2001.

3.2.7 Authentication

lopk	IstGalOSNMAPublicKeys					

Use this command to retrieve the list of applicable OSNMA public keys.

The list contains user-defined public keys, as introduced with **setGalOSNMAPublicKeys** command, possibly updated with new keys provided through the Galileo OSNMA protocol (over the air).

This command is very similar to the command **getGalOSNMAPublicKeys**, the only difference being that the latter only reports the list of user-defined public keys.

```
COM1> lstGalOSNMAPublicKeys <CR>
$R; lstGalOSNMAPublicKeys
---->
$-- BLOCK 1 / 1
   GalOSNMAPublicKeys, Key0, ""
   GalOSNMAPublicKeys, Key1, "MFkwEwYHKoZIzj0CAQYIKoZIzj0DAQcDQgAE+
        Q2wvmvfdQg1sQF6OmCEy8skCSiu79vBnRrKmaPpCJnaMOOvm26Us6ELhebL+
        q75MAyWAXJjlyRZZwp68gSAHw=="
...
COM1>
```

sopk	setGalOSNMAPublicKeys	ID	Key (213)				
gopk	getGalOSNMAPublicKeys	ID					
		+ Key0 Key15					
		all					

RxControl: Navigation > Advanced User Settings > Authentication > Galileo OSNMA

Public keys for live OSNMA operation are hardcoded in the receiver, as they are not expected to change frequently. In order to have the OSNMA function operate with live signals, the user is not required to input any keys.

However, in simulated environments, different keys may be needed and they can be provided with this command. OSNMA defines 16 different keys which can be provided individually with the *ID* and *Key* arguments.

The format of the Key argument is equivalent to PEM (Private Mail Enhanced), a Base64 encoded certificate, but without the "—BEGIN—" header and "—END—" footer.

! If the keys provided with this command do not correspond to the Galileo keys, the receiver will not be able to authenticate live Galileo messages. Make sure to delete all user-selected keys (e.g. with the setGalOSNMAPublicKeys, all, "" command) when leaving the simulated environment.

Example

COM1> sopk, Key2, ME4wEAYHKoZIzj0CAQYFK4EEACEDOgAEnAtF3t3kbYx6tH80MEIuis+ HtLdGNGU8Cj8kUesPfc/OEbNRcbedY5iQHsc+t5bEN0GV6gkLIp0= <CR>

sou	setGalOSNMAUsage	PVTLevel	MTRoot (65)	MeasLevel			
gou	getGalOSNMAUsage						
		<u>off</u>		<u>off</u>			
		loose		loose			
		strict					

RxControl: Navigation > Advanced User Settings > Authentication > Galileo OSNMA

Use this command to configure the Galileo OSNMA processing of the receiver.

The *PVTLevel* argument defines the level at which the PVT engine applies OSNMA authentication. If set to off, the engine ignores OSNMA authentication checks and may use satellites flagged as non-authentic.

In loose mode, in case authentication fails for a particular satellite, it is excluded from the PVT. In all other cases (authentication successful or unknown), it is used in the PVT computation.

In strict mode, only proven authentic satellites are included in the PVT. Satellites for which authentication is not available (e.g. BeiDou satellites) or which have not been verified yet are excluded. The reported PVT solution is solely based on authenticated satellites.

Another difference between loose and strict modes is the usage of an NTP time server. In loose mode, NTP access is optional. In strict mode, authentication requires NTP access. See also the **setNTPClient** command.

The *MTRoot* argument allows users to specify the root of the Merkle Tree used to validate new public keys. The format is an hexademical string representing the bits of the key. This is only needed in simulated environments. When using the receiver for live OSNMA operation, no Merkle Root key should be specified (the argument should be left blank).

The *MeasLevel* argument specifies whether measurements (pseudoranges, carrier phases, ...) should be produced for satellites for which Galileo authentication failed. When off, OSNMA does not affect the generation of measurements. When loose, measurements from non-authentic satellites are discarded in all internal processing and in all receiver output streams and log files. Measurements from satellites of which the authenticity could not be determined are not discarded.

Note that satellites excluded at measurement level are de-facto also excluded at PVT level, regardless of the *PVTLevel* setting. In other words, when *MeasLevel* is loose, there is no distinction between *PVTLevel*=off and *PVTLevel*=loose.

3.2.8 Attitude Determination

sal	setAntennaLocation	Antenna	Mode	DeltaX	DeltaY	DeltaZ		
gal	getAntennaLocation	Antenna						
		+ Base all	auto manual	-1000.0000 <u>0.0000</u> 1000.0000	-1000.0000 <u>0.0000</u> 1000.0000 m	-1000.0000 <u>0.0000</u> 1000.0000		

RxControl: Navigation > Positioning Mode > GNSS Attitude

Use this command to define/inquire the relative location of the antennas in the vehicle reference frame in the context of attitude determination. See appendix A for a description of the vehicle reference frame.

The attitude of a vehicle (more precisely the heading and pitch angles) can be determined from the orientation of the baseline between two antennas attached to the vehicle. These two antennas must be connected to two receivers configured in moving-base RTK operation. Use the command **setGNSSAttitude** to enable attitude determination.

In moving-base attitude, **setAntennaLocation** should be invoked at the rover receiver with the *Antenna* argument set to Base to specify the relative position of the base antenna with respect to the rover antenna.

In auto mode, the receiver determines the attitude angles assuming that the baseline between the antenna ARPs is parallel to the longitudinal axis of the vehicle, and that the base antenna is in front of the rover antenna (i.e. towards the direction of movement). The length of the baseline is automatically computed by the receiver, and the baseline may be flexible. The <code>DeltaX</code>, <code>DeltaY</code> and <code>DeltaZ</code> arguments are ignored in <code>auto</code> mode.

In manual mode, the user can specify the exact position of the base antenna with respect to the rover antenna in the vehicle reference frame. Selecting manual mode implies that the baseline is rigid. The *DeltaX*, *DeltaY* and *DeltaZ* coordinates are ARP-to-ARP.

Example

In the case of moving-base attitude determination, if the moving-base antenna is located one meter to the left of the rover antenna, and 10 cm below, you should use:

```
COM1> sal, Base, manual, 0, -1, 0.1 <CR>
$R: sal, Base, manual, 0, 1, 0.1
   AntennaLocation, Base, manual, 0.0000, -1.0000, 0.1000
COM1>
```

sto	setAttitudeOffset	Heading	Pitch				
gto	getAttitudeOffset						
		-360.000 <u>0.000</u> 360.000 deg	-90.000 <u>0.000</u> 90.000 deg				

RxControl: Navigation > Positioning Mode > GNSS Attitude

Use this command to specify the offsets that the receiver applies to the computed attitude angles.

The attitude of a vehicle can be determined from the orientation of the baseline between two antennas attached to the vehicle. By default, the receiver determines the attitude angles assuming that the baseline between the antenna ARPs is parallel to the longitudinal axis of the vehicle. Attitude biases appear when this is not the case. The user can use this command to provide the value of the biases, such that the receiver can compensate for them before outputting the attitude.

The receiver subtracts the provided biases from the attitude angles before encoding them in NMEA or in the AttEuler SBF block.

Another way to avoid attitude biases is to provide the accurate position of the antennas in the vehicle reference frame. See the command **setAntennaLocation** for more details.

```
COM1> sto, 93.2, -0.4<CR>
$R: sto, 93.2, -0.4
   AttitudeOffset, 93.200, -0.400
COM1>
```

sga	setGNSSAttitude	Source				
gga	getGNSSAttitude					
		<u>none</u>				
		MovingBase				

RxControl: Navigation > Positioning Mode > GNSS Attitude

Use this command to define/inquire the way GNSS-based attitude is computed.

The attitude of a vehicle (more precisely the heading and pitch angles) can be determined from the orientation of the baseline between two antennas attached to the vehicle. See also the **setAntennaLocation** command.

The *Source* argument specifies how to compute the GNSS-based attitude:

Source	Description
none	GNSS attitude computation is disabled.
MovingBase	Attitude is computed from the baseline between antennas connected to two receivers configured in moving-base RTK operation (moving-base attitude).

Example

COM1> sga, none<CR>
\$R: sga, none
 GNSSAttitude, none

3.2.9 Datum Definition

sgd	setGeodeticDatum	TargetDatum				
ggd	getGeodeticDatum					
		WGS84				
		ETRS89				
		NAD83				
		NAD83_PA				
		NAD83_MA				
		GDA94				
		GDA2020				
		<u>Default</u>				
		User1				
		User2				

RxControl: Navigation > Receiver Operation > Position > Datum

Use this command to define the datum to which you want the coordinates to refer.

TargetDatum	Description
WGS84	Equivalent to Default
ETRS89	European ETRS89 (ETRF2000 realization)
NAD83	NAD83(2011), North American Datum (2011)
NAD83_PA	NAD83(PA11), North American Datum, Pacific plate (2011)
NAD83_MA	NAD83(MA11), North American Datum, Marianas plate (2011)
GDA94	GDA94(2010), Geocentric Datum of Australia (2010)
GDA2020	GDA2020, Geocentric Datum of Australia 2020
Default	Default datum, which depends on the positioning mode as explained below except when a built-in local coordinate operation is manually selected with the setLocalCoordOperation command. In that case, the datum is set accordingly to the selected coordinate operation.
User1	First user-defined datum. The corresponding transformation parameters must be specified by the setUserDatum and setUserDatumVel commands, while the corresponding ellipsoid must be defined by the setUserEllipsoid command.
User2	Second user-defined datum

By default (argument *TargetDatum* set to Default), the datum depends on the positioning mode:

- In standalone or SBAS mode, the coordinates refer to a global datum: WGS84 or ITRF (recent realisations of WGS84 and ITRF are closely aligned and the receiver considers them equivalent).
- In DGNSS or RTK mode, the datum depends on the type of differential corrections, as can be found in the WACorrInfo field of the PVTCartesian and PVTGeodetic SBF blocks. For State-Space Representation (SSR) corrections, the coordinates refer to WGS84/ITRF. Otherwise, the coordinates refer to the regional datum of the DGNSS/RTK provider.

With this command, the user can select the datum the coordinates should refer to. In case you are using corrections from a regional DGNSS/RTK provider, the datum to be specified here must be the datum used by your correction provider.

When a non-default datum is selected, the receiver transforms all WGS84/ITRF coordinates to the specified datum. Positions obtained using local or regional DGNSS/RTK corrections are not transformed, as it is assumed that the selected datum is the one used by the regional DGNSS/RTK provider.

In the current firmware version, the WGS84 value for the *TargetDatum* argument has no effect, but it is kept for backwards compatibility reasons. Setting *TargetDatum* to WGS84 is equivalent to setting it to Default.

Example

COM1> sgd, ETRS89 <CR>
\$R: sgd, ETRS89
 GeodeticDatum, ETRS89
COM1>

sud setUser[Datum	Datum	Tx	Ту	Tz	Rx	Ry	Rz	D	
gud getUserI	Datum	Datum								
		+ User1 + User2 all	-2000000.00 <u>0.00</u> 2000000.00 mm	<u>0.00</u> 2000000.00	-2000000.00 <u>0.00</u> 2000000.00 mm	-100.0000 0.0000 100.0000 mas	-100.0000 <u>0.0000</u> 100.0000 mas	-100.0000 <u>0.0000</u> 100.0000 mas	-100.00000 <u>0.00000</u> 100.00000 ppb	

RxControl: Navigation > Receiver Operation > Position > Datum

Use these commands to define datum transformation parameters from the global WGS84/ITRF datum to the user datum identified by the first argument.

The receiver applies the linearized form of the Helmert similarity transformation. The coordinates in WGS84/ITRF are transformed to the user datum using the following formula:

$$\begin{pmatrix} X \\ Y \\ Z \end{pmatrix}_{User} = \begin{pmatrix} T_x \\ T_y \\ T_z \end{pmatrix} + \begin{pmatrix} D+1 & -R_z & R_y \\ R_z & D+1 & -R_x \\ -R_y & R_x & D+1 \end{pmatrix} \cdot \begin{pmatrix} X \\ Y \\ Z \end{pmatrix}_{WGS84/ITRF}$$

where T_x , T_y and T_z are the three translation components, R_x , R_y and R_z are the rotation angles and D is the scale factor. Note that the rotation angles are expressed in radians in the above formula, but they must be provided in milliarcsecond (1 mas = $2\pi/360/3600000$ radians) in the arguments of the command. The sign convention corresponds to that of the IERS Conventions (2010), Technical Note No. 36.

The time derivative of the transformation parameters can be specified with the command **setUserDatumVel**.

For the receiver to apply the transformation parameters, the corresponding user datum must be selected in the **setGeodeticDatum** command.

sudv	setUserDatumVel	Datum	TxVel	TyVel	TzVel	RxVel	RyVel	RzVel	DVel	RefYear
gudv	getUserDatumVel	Datum								
		+ User1		-2000.00 <u>0.00</u>			-10.0000			1900.00
		+ User2	2000.00 mm/yr	20000.00 mm/yr	2000.00 mm/yr		<u>0.0000</u> 10.0000		<u>0.00000</u> 1.00000 ppb/yr	<u>2000.00</u> 2100.00 yr
		all		,				mas/yr	'' '	,

RxControl: Navigation > Receiver Operation > Position > Datum

Use these commands to define the time derivative of the seven datum transformation parameters defined with the **setUserDatum** command.

For instance, *TxVel* is the yearly change of the X-translation component. At the epoch specified with *RefYear* (in decimal years), the X-translation component is *Tx* as defined in **setUserDatum**. One year later, the X-translation component is *Tx+TxVel*, etc.

Refer to the **setUserDatum** command for a description of the datum transformation formula implemented in the receiver.

sue	setUserEllipsoid	Datum	Α	Invf			
gue	getUserEllipsoid	Datum					
		+ User2	6300000.000 6378137.000 6400000.000 m	290.000000000 298.257223563 305.0000000000			

RxControl: Navigation > Receiver Operation > Position > Datum

Use these commands to define the ellipsoid associated with the User1 or User2 datum. a is the reference ellispoid semi-major axis and Invf is the inverse of the flattening. See also the setGeodeticDatum and the setUserDatum commands.

Example

COM1> sue, User1, 6378388, 297 <CR>
\$R: sue, User1, 6378388, 297
 UserEllipsoid, User1, 6378388.000, 297.000000000

```

slco	setLocalCoordOperation	OpName (100)	ENHTransfo			
glco	getLocalCoordOperation					
		NETWORK	<u>none</u>			
			lt1			

RxControl: Navigation > Receiver Operation > Position > Local Transformations

Use this command to define the set of operations needed to obtain coordinates in a local coordinate reference system (CRS). The coordinates in the local CRS can be geodetic coordinates (latitude, longitude and local height) reported in the PosLocal SBF block, and/or plane grid coordinates (easting, northing) reported in the PosProjected SBF block.

The list of possible operations, i.e. the list of valid values for the *OpName* argument, is returned by the <code>lstLocalCoordOperations</code> command. The list contains at least two entries: <code>NONE</code>, which disables the local operations, and <code>NETWORK</code>, which instructs the receiver to use the operation set provided by the <code>DGNSS/RTK</code> service provider. In addition, a number of built-in operations are also available. The <code>NETWORK</code> operation is the default.

If the *OpName* argument does not match any entry in the list returned by <code>lstLocalCoordOperations</code>, <code>NONE</code> is assumed.

When selecting the NETWORK mode, it is recommended to specify the regional datum in which the network operates, using the **setGeodeticDatum** command. This allows the receiver to continue to output local coordinates during RTK/DGNSS outages without datum shift issues. This is not needed when selecting one of the built-in operations.

In some cases, a final adjustment is still needed to obtain accurate plane grid coordinates. The *ENHTransfo* argument can be used for that purpose. It selects a local transformation to be applied as final step in the computation of the easting, northing and local height. The corresponding transformation parameters must be set with the **setENHTransfoHorizontal** and **setENHTransfoVertical** commands. By default, this final adjustment is disabled.

```

3.2.11 Timing and Time Management

scst	setClockSyncThreshold	Threshold	StartupSync				
gcst	getClockSyncThreshold						
		ClockSteering	<u>off</u>				
		<u>usec500</u>	on				
		msec1					
		msec2					
		msec3					
		msec4					
		msec5					

RxControl: Navigation > Receiver Operation > Timing

Use these commands to define/inquire the maximum allowed offset between the receiver internal clock and the system time defined by the **setTimingSystem** command.

If the argument <code>ClockSteering</code> is selected, the receiver internal clock is continuously steered to the system time to within a couple of nanoseconds. Clock steering accuracy is dependent on the satellite visibility, and it is recommended to only enable it under open-sky conditions.

If any other argument is selected, the internal clock is left free running. Synchronization with the system time is done through regular millisecond clock jumps. More specifically, when the receiver detects that the time offset is larger than *Threshold*, it initiates a clock jump of an integer number of milliseconds to re-synchronise its internal clock with the system time. These clock jumps have no influence on the generation of the xPPS pulses: the xPPS pulses are always maintained within a few nanoseconds from the requested time, regardless of the value of the *Threshold* argument.

The *StartupSync* argument can be used to force the receiver to start with a small clock bias value (less than 100ns). This setting will only have effect at the next reset or reboot of the receiver. So, when enabling startup synchronization (*StartupSync* set to on), do not forget to save the configuration in the boot configuration file with the **exeCopyConfigFile** command

This argument has no effect when clock steering is enabled.

Refer to section 2.3 for a more detailed description of the time keeping in your receiver.

```
COM1> scst, msec1, off<CR>
$R: scst, msec1, off
  ClockSyncThreshold, msec1, off
COM1>
```

sep	setEventParameters	Event	Polarity	Delay			
gep	getEventParameters	Event					
		+ EventA + EventB all	High2Low	-500.000000 0.000000 500.000000 ms			

Use these commands to define/inquire the polarity of the electrical transition on which the receiver will react on its Event input(s). The polarity of each event pin can be set individually or simultaneously by using the value all for the *Event* argument.

The command also allows defining a time delay for each event. This can be handy when the electrical transition at the event pin is not synchronous with the actual event that needs to be timed. For example, if the electrical transition occurs 100 milliseconds prior to the actual event of interest, the *Delay* argument must be set to 100. *Delay* is positive when the event of interest occurs after the electrical transition, and negative otherwise.

The event time (corrected by the specified delay) is available in the <code>ExtEvent SBF</code> block. The position at that time is available in the <code>ExtEventPVTCartesian</code> and <code>ExtEventPVTGeodetic SBF</code> blocks and the attitude angles in the <code>ExtEventAttEuler SBF</code> block. Beware that, when using large <code>Delay</code> values in high-dynamics conditions, the position accuracy may degrade.

Note that the *Delay* argument has no effect when an event pin is configured in TimeSync mode with the **setTimeSyncSource** command.

```
COM1> sep, EventA, High2Low, 10
$R: sep, EventA, High2Low, 10
   EventParameters, EventA, High2Low, 10.000000
COM1>
```

snc gnc	setNtpClient getNtpClient	Mode	Server (45)				
		off on	default				

Use this command to configure the retrieval of the time from an external NTP time server. Getting the time from an external source can help the receiver to perform some sanity checks on the signal received from the GNSS satellites. It is fully optional, except in case of strict OSNMA operation (see the **setGalOSNMAUsage** command).

If *Mode* is on, the receiver will attempt to get the current time from the NTP server specified with the *Server* argument.

The *Server* argument accepts a host name or a raw IP address. If set to "default", a server is automatically selected by the receiver.

Accessing the NTP server requires the receiver to have access to the Internet. If the receiver is not connected to a network, the access fails with no error message.

```
COM1> snc, on, pool.ntp.org<CR>
$R: snc, on, pool.ntp.org
  NtpClient, on, pool.ntp.org
COM1>
```

sntp gntp	setNTPServer getNTPServer	Enable				
		<u>off</u>				
		on				
						i

Use this command to enable or disable the built-in NTP (Network Time Protocol) server.

When enabled, the NTP server accepts UDP timestamp requests on port number 123.

Example

COM1> sntp, on<CR>
\$R: sntp, on
 NTPServer, on
COM1>

spps	setPPSParameters	Interval	Polarity	Delay	TimeScale	MaxSyncAge	PulseWidth		
gpps	getPPSParameters								
		off	Low2High	-1000000.00	<u>GPS</u>	0 <u>60</u> 3600 s			
		msec10	High2Low	<u>0.00</u> 1000000.00 ns	Galileo		<u>5.000000</u> 1000.000000		
		msec20			BeiDou		ms		
		msec50			GLONASS				
		msec100			UTC				
		msec200			RxClock				
		msec250							
		msec500							
		sec1							
		sec2							
		sec4							
		sec5							
		sec10							
		sec30							
		sec60							

Use these commands to define/inquire the parameters of the x-pulse-per-second (xPPS) output. Refer to section 1.20 for additional information on the xPPS functionality.

The *Interval* argument specifies the time interval between the pulses. A special value "off" is defined to disable the xPPS signal.

The *Polarity* argument defines the polarity of the xPPS signal.

The *Delay* argument can be used to compensate for the overall signal delays in the system (including antenna, antenna cable and xPPS cable). Setting *Delay* to a higher value causes the xPPS pulse to be generated earlier. For example, if the antenna cable is replaced by a longer one, the overall signal delay could be increased by, say, 20 ns. If *Delay* is left unchanged, the xPPS pulse will come 20 ns too late. To re-synchronize the xPPS pulse, *Delay* has to be increased by 20 ns. Note that the *Delay* argument of **setPPSParameters** only changes the position of the xPPS pulse with no other effect on the receiver. An alternative way of compensating for signal delays is by using the **setCalibCommonDelay** command. With that command, the delay is compensated at pseudorange level, indirectly affecting the position of the xPPS pulse.

The xPPS pulses are aligned with the time system set with the *TimeScale* argument. RxClock corresponds to the receiver time scale. When setting *TimeScale* to RxClock, the xPPS pulses are synchronous with the internal measurement epochs.

The xPPS timing information is derived primarily from the satellites of the system selected with the *TimeScale* argument. If there is no satellite from that system available, the receiver will use information from other constellations to maintain the continuity of the pulses. If all satellite signals are blocked, the xPPS pulses will continue to be generated for a duration set with the *MaxSyncAge* argument. If *MaxSyncAge* is set to 0, or if *TimeScale* is set to RxClock, this timeout is disabled.

The *PulseWidth* argument sets the duration of the PPS pulse. Note that the receiver will always stop the pulse shortly before the start of the next pulse, even if the requested *PulseWidth* is longer than the interval between pulses.

Note that, when *Interval* is off, the PPS behaves as a general-purpose output. Its level is low if *Polarity* is Low2High, and high if it is High2Low. The other arguments have no effect.

Example

COM1> spps, sec1, Low2High, 23.40, GPS, 60, 0.1<CR>
\$R: spps, sec1, Low2High, 23.40, GPS, 60, 0.1
 PPSParameters, sec1, Low2High, 23.40, GPS, 60, 0.100000
COM1>

 setPTPServer getPTPServer	Enable				
	<u>off</u>				
	on				

Use this command to enable or disable the built-in PTP (Precise Time Protocol) server.

When enabled, the PTP server will broadcast the time on the local network using the UDP transport protocol.

Example

COM1> sptp, on<CR>
\$R: sptp, on
 PTPServer, on
COM1>

stss	setTimeSyncSource	Source				
gtss	getTimeSyncSource					
		<u>none</u>				
		EventA				
		EventB				

Use this command to set which event input pin to be used as TimeSync input. It only takes effect at the next reset or reboot, so do not forget to save the configuration in the boot configuration file with exeCopyConfigFile after entering the setTimeSyncSource command.

When an event pin is configured as TimeSync input, the receiver expects to get a one-persecond time pulse on that pin. At startup, it will synchronize its internal time base (i.e. the time at which GNSS measurements are taken) to those pulses, with an offset of a few tens of nanoseconds plus an integer number k of milliseconds. k is set such that the difference between the internal time base and GNSS time does not exceed the limit set with the **setClockSyncThreshold** command (0.5 ms by default). An ExtEvent SBF block is generated for each pulse, and k can be obtained from the TOW and the Offset fields of that SBF block, using the formula:

k = round(round(TOW*0.001 + Offset) * 1000 - (TOW + Offset*1000)).

If k is positive, the receiver time is in advance of the time pulses by k milliseconds. If it is negative, it lags the time pulses by k milliseconds.

The expected time pulse polarity (rising or falling edge) is set with the setEventParameters command.

A typical use case of the TimeSync input is in conjunction with the REF IN input: the receiver is fed with a 10 MHz frequency reference on its REF IN input, and to a one-per-second time pulse derived from the same frequency reference on its TimeSync input.

Example

COM1> stss, EventB<CR>
\$R: stss, EventB
 TimeSyncSource, EventB
COM1>

sts	setTimingSystem getTimingSystem	System				
gts	getTimingSystem					
		Galileo				
		GPS				
		BeiDou				
		<u>auto</u>				

Use these commands to define/inquire the reference time system for the computation of the receiver clock bias.

As part of the PVT computation, the receiver determines the offset between its own time (receiver time) and the time of the GNSS system specified with the System argument. This offset is reported in the RxClkBias field of the PVTCartesian and PVTGeodetic SBF blocks.

! Note that at least one satellite of the selected system must be visible and tracked by the receiver. Otherwise no PVT will be computed.

When the System argument is set to auto, the receiver automatically selects the GNSS system according to the availability of satellites. This is the recommended setting.

Example

COM1> sts, GPS<CR> \$R: sts, GPS TimingSystem, GPS

3.2.12 Station Settings

smp	setMarkerParameters	MarkerName (60)	MarkerNumber (2	MarkerType (20)	StationCode (10)	Monumentldx	ReceiverIdx	CountryCode (3)	
gmp	getMarkerParameters								
		<u>SEPT</u>	<u>Unknown</u>	Unknown		<u>0</u> 9	<u>0</u> 9		

RxControl: Navigation > Receiver Setup > Station Settings

Use these commands to define/inquire the marker and station parameters.

The set of allowed characters for the *MarkerName* argument and for the *StationCode* argument is limited to:

```
_0123456789ABCDEFGHIJKLMNOPQRSTUVWXYZabcdefghijklmnopqrstuvwxyz
```

The *StationCode* argument is the site code associated to the station (typically four characters). *Monumentldx* can be used to identify the monument when there are multiple monuments at the same station. *Receiverldx* can be used to identify the receiver when there are multiple receivers at the same monument. A three-letter ISO country code can be specified with the *CountryCode* argument.

If internal logging is enabled in one of the IGS file naming modes, the file name depends on the settings of the **setMarkerParameters** command. Refer to the description of the logging commands (**setFileNaming**, **setRINEXLogging**) for details.

The parameters set by this command are copied into the ReceiverSetup SBF block, which defines the file name and the header contents when converting SBF files into RINEX with the sbf2rin program.

```
COM1> smp, Test, 356, GEODETIC, TST1, 0, 0, BEL<CR>
$R: smp, Test, 356, GEODETIC, TST1, 0, 0, BEL

COM1>
```

soc	setObserverComment	Comment (120)				
goc	getObserverComment					
		<u>Unknown</u>				

RxControl: Navigation > Receiver Setup > Station Settings

Use these commands to define/inquire the content of the ${\tt Comment}$ SBF block.

Examples

COM1> soc, "Data taken with choke ring antenna" <CR>
\$R: soc, "Data taken with choke ring antenna"
 ObserverComment, "Data taken with choke ring antenna"
COM1>

COM1> goc <CR>
\$R: goc
 ObserverComment, "Data taken with choke ring antenna"
COM1>

sop	setObserverParameters	Observer (20)	Agency (40)				
gop	getObserverParameters						
		<u>Unknown</u>	<u>Unknown</u>				

RxControl: Navigation > Receiver Setup > Station Settings

Use these commands to define/inquire the observer name or ID, and his/her agency. These parameters are copied in the ReceiverSetup SBF block and in the header of RINEX observation files.

The length of the arguments complies with the RINEX format definition.

```
COM1> sop, TestObserver, TestAgency <CR>
$R: sop, TestObserver, TestAgency
  ObserverParameters, "TestObserver", "TestAgency"
COM1>

COM1> gop <CR>
$R: gop
  ObserverParameters, "TestObserver", "TestAgency"
COM1>
```

3.2.13 General Input/Output

lad	IstAsciiDisplay					

Use this command to output the current ASCII Display. The ASCII Display is a textual report of the tracking and PVT status. It can be used to get a quick overview of the receiver operation.

This command outputs a single ASCII Display. Use the **setDataInOut** command to enable the ASCII Display at a 1-Hz rate.

```
COM1> lstAsciiDisplay <CR>
$R; lstAsciiDisplay

			baud2000000						
			baud2500000						
			baud3000000						
			baud3500000						
			baud4000000						

RxControl: Communication > COM Port Settings

Use these commands to define/inquire the communication settings of the receiver's COM ports. By default, all COM ports are set to a baud rate of 115200 baud, using 8 data-bits, no parity, 1 stop-bit and no flow control.

Depending on your receiver hardware, it may be that not all COM ports support flow control. Please refer to the receiver Hardware Manual or User Manual to check which COM ports are equipped with the RTS/CTS lines.

When modifying the settings of the current connection, make sure to also modify the settings of your terminal emulation program accordingly.

```
COM1> scs, COM1, baud19200, bits8, No, bit1, RTS|CTS<CR>
$R: scs, COM1, baud19200, bits8, No, bit1, RTS|CTS
    COMSettings, COM1, baud19200, bits8, No, bit1, RTS|CTS
COM1>
```

scda	setCrossDomainWebAccess	Mode				
gcda	getCrossDomainWebAccess					
		<u>off</u>				
		on				

RxControl: Communication > Network Settings > General

This command enables or disables true open access across domain boundaries according to the CORS specification (Cross-Origin Resource Sharing).

Setting the *Mode* argument to on enables the cross-domain access to the receiver web server, and as such it allows external client applications (e.g. your own web application) to access receiver data via HTTP requests. Please contact Septentrio support for additional information on the receiver's JavaScript libraries.

Example

COM1> scda, on <CR>
\$R: scda, on
 CrossDomainWebAccess, on
COM1>

sdcm	setDaisyChainMode	DC	Mode				
gdcm	getDaisyChainMode	DC					
		+DC1	Raw				
		+ DC2	ASCII				
		all	RTCMv3				

RxControl: Communication > Input/Output Selection

Use this command to define how data is transferred in a daisy chain configured with the **setDataInOut** command.

By default (Mode is Raw), incoming bytes are transferred in small chunks from the input to the output connector.

In some cases, it is preferred to transmit complete ASCII strings at once. This can be done by configuring the daisy chain in ASCII mode. A string is considered complete when a carriage-return and/or a line-feed character is received. Similarly, if *Mode* is set to RTCMv3, recognized RTCMv3 messages are transmitted at once.

Example

COM1> sdcm, DC1, ASCII<CR>
\$R: sdcm, DC1, ASCII
 DaisyChainMode, DC1, ASCII
COM1>

		+ IPS5						
		+ IPR1						
		+ IPR2						
		+ IPR3						
		+ IPR4						
		+ IPR5						
		all						

RxControl: Communication > Input/Output Selection

Use these commands to define/inquire the type of data that the receiver should accept/send on a given connection descriptor (*Cd* - see 1.2.5).

The *Input* argument is used to tell the receiver how to interpret incoming bytes on the connection *Cd*. If a connection is to be used for receiving user commands or differential corrections, it is recommended to leave it in the default auto input mode. In this mode, the receiver automatically detects the input format.

It is also possible to set the input format explicitly. CMD means that the connection is to be used for user command input exclusively. ASCIIIN is used for connections receiving free-formatted ASCII messages, e.g. from an external meteo sensor.

In auto mode, the receiver automatically detects user commands and incoming differential corrections in RTCM or CMR format. Other types of input must be specified explicitly.

A connection that is not configured in CMD mode or auto mode will be blocked for user commands. There are two ways to re-enable the command input on a blocked connection. The first way is to reconfigure the connection by entering the command <code>setDataInOut</code> from another connection. The second way is to send the "escape sequence" consisting of a succession of ten "S" characters to the blocked connection within a time interval shorter than 5 seconds.

A connection that is configured in auto mode will initially accept user commands and differential corrections. However, as soon as differential corrections have been detected, the connection is blocked for user commands until the escape sequence is received.

The *Output* argument is used to select the types of data allowed as output. The receiver supports outputting different data types on the same connection. The ASCIIDisplay is a textual report of the tracking and PVT status at a fixed rate of 1Hz. It can be used to get a quick overview of the receiver operation.

The LBandBeami option is to output the stream of bytes decoded from an L-Band beam (not available for some proprietary streams). The Encapsulate option has the effect of encapsulating all non-SBF output into the EncapsulatedOutput SBF block. For instance, setting the *Output* argument to NMEA+Encapsulate instructs the receiver to encapsulate all NMEA messages into the EncapsulatedOutput SBF block.

When opening an IPxx connection, the *Input* and *Output* modes are always reset to their default value.

DC1 and DC2 represent two internal pipes that can be used to create a daisy-chain. Set the *Input* argument to DCi to connect the input of pipe i to the specified connection. Set the *Output* argument to DCi to connect the output of pipe i to the specified connection. The daisy-chain can operate in binary or ASCII mode, as configured with the **setDaisyChainMode** command.

After the *Cd*, *Input* and *Output* arguments, an extra read-only *Show* argument will be returned in the command reply. This last argument can take the value on, off or waiting, depending on whether the connection descriptor is open, close, or waiting for a connection.

The *Input* argument is ignored for output-only connections, and the *Output* argument is ignored for input-only connections. See section 1.2.5 for details.

Note that not all input connections can accept user commands, check section 1.2.5 for details.

Examples

```
COM1> sdio, COM1, CMD <CR>
$R: sdio, COM1, CMD
  DataInOut, COM1, CMD, SBF, (on)
COM1>
```

On receivers that have three COM ports, to set up a two-way daisy-chain between COM2 and COM3, i.e. to have all incoming bytes from COM2 redirected to COM3 and all incoming bytes from COM3 redirected to COM2, enter the following commands from a connection different than COM2 and COM3:

```
COM1> sdio, COM2, DC1, DC2 <CR>
$R: sdio, COM2, DC1, DC2
   DataInOut, COM2, DC1, DC2, (on)
COM1> sdio, COM3, DC2, DC1 <CR>
$R: sdio, COM3, DC2, DC1
   DataInOut, COM3, DC2, DC1, (on)
COM1>
```

sdds	setDynamicDNS	Provider	UserName (40)	Password (40/2)	Hostname (40)	Bind		
gdds	getDynamicDNS			(3)				
		<u>off</u>				<u>auto</u>		
		dyndns.org				Ethernet		
		no-ip.com						

RxControl: Communication > Network Settings > DynDNS

This command configures the built-in dynamic DNS client (DynDNS or DDNS).

Before using DynDNS, you will need to create an account and define a hostname for your receiver at one of the supported DynDNS providers. The list of supported providers is shown below.

Provider	Description
off	DynDNS disabled
dyndns.org	dyndns.org
no-ip.com	no-ip.com

The Provider argument specifies your DynDNS provider, the UserName and Password arguments specify the account credentials at this provider, and the *Hostname* is the full hostname associated to your receiver. Setting the *Provider* to off disabled the DynDNS functionality.

On receivers with multiple active network interfaces, the receiver registers the public IP address of the interface with the highest priority (Ethernet first, then WiFi), unless a specific interface is forced with the *Bind* argument.

The receiver checks every 2 minutes if the public IP address has changed, and updates the DynDNS server if needed. In addition a forced DynDNS server update is performed every 30 days. This is done to prevent the expiration of a DynDNS entry.

1 This is a permanent command: it is automatically stored in the boot configuration file with out needing to call exeCopyConfigFile, and it is not erased even after a reset to factory defaults (see the exeResetReceiver command).

Example

sdds, dyndns.org, Bart, MyPwd, rx1.dyndns-free.com, auto<CR> \$R: sdds, dyndns.org, Bart, MyPwd, rx1.dyndns-free.com, auto DynamicDNS, dyndns.org, Bart, MyPwd, rx1.dyndns-free.com, auto COM1>

Only half of the total password length is available to the user (See Section 3.1.4 on page 66)

n	exeEchoMessage	Cd	Message (242)	EndOfLine
gecm	getEchoMessage			
1		DSK1	A:Unknown	none
		COM1		+ CR

		IPS1		
		IPS2		
		IPS3		
		IPS4		
		IPS5		
i		IPR1		
		IPR2		
		IPR3		
		IPR4		
		IPR5		
		DC1		
		DC2		

RxControl: Communication > Output Settings > Echo Message

Use this command to send a message to one of the connections of the receiver.

The *Message* argument defines the message that should be sent on the Cd port. If the given message starts with "A:", the remainder of the message is considered an ASCII string that will be forwarded without changes to the requested connection. If the given message starts with "H:", the remainder of the message is considered a hexadecimal representation of a succession of bytes to be sent to the requested connection. In this case, the string should be a succession of 2-character hexadecimal values separated by a single whitespace.

Make sure to enclose the string between double quotes if it contains whitespaces. The maximum length of the *Message* argument (including the A: or H: prefix) is 242 characters.

The *EndOfLine* argument defines which end-of-line character should be sent after the message. That argument is ignored when the *Message* argument starts with \mathbb{H} :.

To send a message at a regular interval instead of once, use the command **setPeriodicEcho**.

When the *Cd* argument is DC1 or DC2, the message is injected into one of the internal daisy-chain pipes. See the **setDataInOut** command for details.

Examples

To send the string "Hello world!" to COM2, use:

```
COM1> eecm, COM2, "A:Hello world!", none <CR>
$R: eecm, COM2, "A:Hello world!", none
    EchoMessage, COM2, "A:Hello world!", none
COM1>
```

To send the same string, the following command can also be used:

```
COM1> eecm, COM2, "H:48 65 6C 6C 6F 20 77 6F 72 6C 64 21", none <CR>
```

\$R: eecm, COM2, "H:48 65 6C 6C 6F 20 77 6F 72 6C 64 21", none EchoMessage, COM2, "H:48 65 6C 6C 6F 20 77 6F 72 6C 64 21", none COM1>

shs	setHttpsSettings	Protocol				
ghs	getHttpsSettings					
		none				
		+ HTTP				
		+HTTPS				
		all				

RxControl: Communication > Network Settings > Security

This command can be used to enable or disable HTTP and/or HTTPS access to the receiver. By default, both HTTP and HTTPS are enabled. Beware that disabling HTTP and HTTPS via the web interface of the receiver, will disconnect the user immediately.

Secure HTTP access requires the user to provide a TLS certificate to the receiver. This is done by navigating to the "Communication > Web Server/TLS" page of the web interface, and uploading a .pem file containing the certificate and its corresponding private key. By default, if no user-provided certificate is available, the receiver will use a self-signed certificate instead. The user-provided certificate can be erased with **exeResetReceiver**, **hard**, **TLSCertificate** command, reverting to the self-signed certificate.

Note that the same certificate is used for all TLS-based services in the receiver, incuding for example the built-in NTRIP caster in TLS mode. See also the **setNtripCasterSettings** command.

Example

COM1> shs, HTTP<CR>
\$R: shs, HTTP
 HttpsSettings, HTTP
COM1>

gipf getIPFiltering	
off on	

RxControl: Communication > Network Settings > Security

Use this command to configure the IP filtering functionality. When IP filtering is enabled, only the specified IP addresses are allowed to connect to the receiver.

By default, IP filtering is off (the Mode argument is off) and the receiver accepts connections from any IP address.

When enabling IP filtering (*Mode* set to on), the *AddrList* argument must contain a whitespace-separated list of IP addresses (IPv4) allowed to connect to the receiver. Only IP addresses are allowed here, not hostnames. To enable a whole range of IP addresses, a netmask can also be specified using the so-called "slash notation" or "CIDR notation", where the IP address is followed by a forward slash (/) and the prefix length number, from 0 to 32. Remember to enclose the *AddrList* argument between double quotes whenever it contains whitespaces.

After entering the command, existing IP connections are kept active, but any new connection from a non-allowed IP address will be rejected.

```
COM1> sipf, on, "192.168.2.0/24 192.168.0.8" <CR>
$R: sipf, on, "192.168.2.0/24 192.168.0.8"

IPFiltering, on, "192.168.2.0/24 192.168.0.8"

COM1>
```

sipk	setIPKeepAlive	Enable	IdleTime	Interval	MaxCount			
gipk	getIPKeepAlive							
		<u>off</u>	<u>15</u> 18000 s	<u>1</u> 3600 s	1 <u>15</u> 3600			
		on						

Use these commands to configure the TCP/IP KeepAlive mechanism.

When enabled, the receiver sends periodic KeepAlive messages over idle IP, IPR and IPS connections to solicit a response from the other end. The *IdleTime* argument sets the idle time after which the first KeepAlive is sent. If the connection stays idle (no response received), other KeepAlive messages are sent every Interval until MaxCount KeepAlives have been sent, after which the connection is closed.

KeepAlive messages are only sent when the connection is idle and no data is being transfered.

Keep in mind that when the *Interval* is set to a low number on a high latency connection, this might cause unnecessary traffic on the connection as well as premature disconnection.

```
COM1> sipk, on, 20, 20, 20<CR>
$R: sipk, on, 20, 20, 20
 IPKeepAlive, on, 20, 20, 20
COM1>
```

sipp	setIPPortSettings	PlaintextCommand	FTPControl	SecureCommand	SSHControl			
gipp	getIPPortSettings							
		1 <u>28784</u> 65535	1 <u>21</u> 65535	1 <u>28783</u> 65535	1 <u>22</u> 65535			

Use these commands to define/inquire the port numbers where the receiver listens for incoming TCP/IP connections.

The PlaintextCommand argument defines the port where the receiver listens for plaintext (unencrypted) user commands.

The FTPControl argument defines the FTP control port number.

The SecureCommand argument defines the port where the receiver listens for secure (SSL/TLS encrypted) user commands.

The SSHControl argument defines the control port number for SFTP and rsync protocols.

! When selecting a port number, make sure to avoid conflicts with other services (for example select a different port than in the **setIPServerSettings** and the setIPReceiveSettings commands). Ports 80 and 443 will be rejected as they are reserved for HTTP and HTTPS.

This is a permanent command: it is automatically stored in the boot configuration file without needing to call exeCopyConfigFile, and it is not erased even after a reset to factory defaults (see the exeResetReceiver command).

```
COM1> sipp, 12345, 21, 54321, 22<CR>
$R: sipp, 12345, 21, 54321, 22
 IPPortSettings, 12345, 21, 54321, 22
COM1>
```

sirs	setIPReceiveSettings	Cd	Port	Mode	TCPAddress (45)			
girs	getIPReceiveSettings	Cd						
		+ IPR1	<u>0</u> 65535	TCP2Way	0.0.0.0			
		+ IPR2		UDP				
		+ IPR3						
		+ IPR4						
		+ IPR5						
		all						

This command configures the "IP receive" ports (IPR).

When *Mode* is set to TCP2Way, the receiver connects to a server using the server's IP address or hostname provided in the TCPAddress argument, as well as the server's port number provided in the Port argument. It then receives all data sent by this server on that port. The TCP2Way connection is bidirectional, and it is possible to send data to the server or to process commands from the server.

When Mode is set to UDP, the receiver listens for incoming UDP messages on its port identified by the Port argument. In UDP mode, the TCPAddress argument is ignored. Note that, contrary to the TCP connection, the UDP connection is unidirectional.

If *Port* is set to 0, the corresponding IPR connection is disabled.

This command is the counterpart of the **setIPServerSettings** command. setIPServerSettings configures the sender side of the communication, while **setIPReceiveSettings** configures the receiver side.

When selecting a port number, make sure to avoid conflicts with other services (for example) select a different port than in the **setIPPortSettings** command).

```
COM1> sirs, IPR1, 28785, TCP2Way, 192.168.10.5<CR>
$R: sirs, IPR1, 28785, TCP2Way, 192.168.10.5
 IPReceiveSettings, IPR1, 28785, TCP2Way, "192.168.10.5"
COM1>
```

siss	setIPServerSettings	Cd	Port	Mode	UDPAddress (252)		
giss	getIPServerSettings	Cd					
		+ IPS1	<u>0</u> 65535	TCP	<u>255.255.255.255</u>		
		+ IPS2		UDP			
		+ IPS3		TCP2Way			
		+ IPS4					
		+ IPS5					
		all					

By default (Mode set to TCP), this command defines the TCP/IP port where the receiver's IP Servers (IPS) listen for incoming TCP/IP connections. When a client connects to an IPS port, all output data specified for that port are streamed to the client.

In TCP mode, the IPS port is unidirectional: it only sends data and incoming bytes are discarded. The TCP2Way mode is the same as the TCP mode, except that the receiver will also process input data (such as user commands or differential corrections). An IPS port configured in TCP2Way mode can only accept a single client at a time.

When Mode is set to UDP and UDPAddress is set to 255.255.255.255, the IPS works in UDP broadcast mode. In that mode, the IPS data stream is delivered to any IPv4 host on the local network listening to the IP port specified by the *Port* argument.

When *Mode* is set to UDP and *UDPAddress* contains a whitespace-separated list of IP addresses or hostnames, the IPS data stream is only delivered to the specified hosts. Remember to enclose the *UDPAddress* argument between double quotes when it contains whitespaces.

Use the **setDataInOut** command and the various output setting commands (e.g. setNMEAOutput) to define the data stream to be output by the IPS connections. Note that the UDP implementation is meant to be used with small data volumes and low update rates. It is the user's responsibility to only enable short messages at low rate when using UDP, in order to prevent throughput degradation of the network.

It is possible to configure some IPS connections in UDP mode, and others in TCP mode. The UPDAddress argument is ignored in TCP mode.

When selecting a port number, make sure to avoid conflicts with other services (for example) select a different port than in the **setIPPortSettings** command).

All IPS connections must use different ports. Set the Port argument to 0 to disable an IPS connection.

```
COM1> siss, IPS1, 28785, UDP, 255.255.255.255<CR>
$R: siss, IPS1, 28785, UDP, 255.255.255.255
 IPServerSettings, IPS1, 28785, UDP, "255.255.255.255"
```

sis	setIPServices	Command	FileTransfer				
gis	getIPServices						
		none	<u>none</u>				
		+ secure	+ FTP				
		+ plaintext	+ SFTP				
		all	+ rsync				
			+SCP				
			all				

This command can be used to enable or disable the supported IP services of the receiver.

If plaintext is enabled in the Command argument, the IP port over which the receiver accepts plaintext (unencrypted) commands is open. If secure is enabled in the Command argument, the IP port over which the receiver accepts SSL/TLS-encrypted commands is open. The corresponding port numbers are specified with the setIPPortSettings command. More specifically, this command enables or disables the user-command ports, and the **setIPPortSettings** command defines the port numbers.

The FileTransfer argument specifies which file-transfer protocols are enabled.

! Sending user commands over the plaintext IP port may be unsuitable in public networks, as they are vulnerable to packet sniffing and man-in-the-middle attacks. Using the secure IP port is advised when possible.

FTP is unsuitable for public networks as it transmits both control and data channels in plaintext, leaving credentials and file contents vulnerable to packet sniffing and man-in-the-middle attacks. SFTP alternative is advised.

```
COM1> sis, secure, SFTP+rsync<CR>
$R: sis, secure, SFTP+rsync
 IPServices, secure, SFTP+rsync
COM1>
```

sips	setIPSettings	Mode	IP (16)	Netmask (16)	Gateway (16)	Domain (63)	DNS1 (16)	DNS2 (16)	MTU	
gips	getIPSettings									
		DHCP	0.0.0.0	<u>255.255.255.0</u>	0.0.0.0		0.0.0.0	0.0.0.0	<u>0</u> 1500	
		Static								I
										ļ

Use these commands to define/inquire the IP (Internet Protocol Version 4) settings of the receiver's Ethernet port. By default, the receiver is configured to use DHCP.

In Static mode, the receiver will not attempt to request an address via DHCP. It will use the specified IP address, netmask, gateway, domain name and DNS. DNS1 is the primary DNS, and DNS2 is the backup DNS. The arguments IP, Netmask, Gateway, Domain, DNS1, and DNS2 are ignored in DHCP mode.

In Static mode, the value of MTU is used as the MTU of the Ethernet port. When MTU is set to 0, the receiver will use the default MTU. In DHCP mode, setting MTU to 0 will result in using the MTU supplied by the DHCP server. When set to any other value, MTU will override the DHCP Server once the link is established. Please note that MTU values smaller than 68 (except 0) are invalid and will be refused.

The command **getIPSettings** cannot be used to get the current IP address assigned to the receiver by the DHCP server. The current IP address can be retrieved from the command **1stInternalFile**, **IPParameters**, or from the IPStatus SBF block.

For the Domain argument only alphanumerical characters, hyphens ('-'), and dots ('.') are accepted.

This is a permanent command: it is automatically stored in the boot configuration file without needing to call exeCopyConfigFile, and it is not erased even after a reset to factory defaults (see the exeResetReceiver command).

RxControl: Communication > Output Settings > Periodic Echo message

Use this command to periodically send a message to one of the connections of the receiver.

The Message argument defines the message that should be sent on the Cd port. If the given message starts with "A:", the remainder of the message is considered an ASCII string that will be forwarded to the requested connection. All occurrences of the %%CR character sequence are replaced by a single carriage return character (ASCII code 13d) and all occurrences of the %%LF character sequence are replaced by a single line feed character (ASCII code 10d). If the Message argument starts with "H:", the remainder of the message is considered a hexadecimal representation of a succession of bytes to be sent to the requested connection. In this case, the string should be a succession of 2-character hexadecimal values separated by a single whitespace.

Make sure to enclose the string between double quotes if it contains whitespaces. The maximum length of the *Message* argument (including the A: or H: prefix) is 201 characters.

The Interval argument defines the interval at which the message should be sent.

To send a message only once, set *Interval* to once. The only difference with the command **exeEchoMessage** is that **exeEchoMessage** cannot be stored in the boot configuration file, while **setPeriodicEcho** can. This can be used to output a message once at each reset or reboot. The third example below shows how to do this.

Examples

To send the string "Hello!<CR><LF>" to COM2 every minute, use:

```
COM1> spe, COM2, "A:Hello!%%CR%%LF", sec60 <CR>
$R: spe, COM2, "A:Hello!%%CR%%LF", sec60
   PeriodicEcho, COM2, "A:Hello!%%CR%%LF", sec60
COM1>
```

The same can be achieved with the following command:

```
COM1> spe, COM2, "H:48 65 6C 6C 6F 21 0D 0A", sec60 <CR>$R: spe, COM2, "H:48 65 6C 6C 6F 21 0D 0A", sec60
```

PeriodicEcho, COM2, "H:48 65 6C 6C 6F 21 0D 0A", sec60 COM1>

To let the receiver output the string "Hello!<CR><LF>" to COM2 at each reset, use the following command sequence:

COM1> spe, COM2, "A:Hello!%%CR%%LF", once <CR>
\$R: spe, COM2, "A:Hello!%%CR%%LF", once
PeriodicEcho, COM2, "A:Hello!%%CR%%LF", once
COM1> eccf, Current, Boot <CR>
\$R: eccf, Current, Boot
CopyConfigFile, Current, Boot

sp2p	setPointToPoint	SessionID	Mode	Cd	ClientIP (20)	ServerIP (20)	Auth	Password (40/2)	ConnectTimeout	ActivityTimeout
gp2p	getPointToPoint	SessionID						(4)		
		+ <u>P2PP1</u>	<u>Off</u>	COM1	192.168.50.2	<u>192.168.50.1</u>	<u>None</u>		<u>60</u> 300 s	10 <u>600</u>
		all	Server	COM2			PAP			32000 s
				СОМЗ			CHAP			
				COM4						

RxControl: Communication > Network Settings > P2P Protocol

The receiver features a Point-to-Point Protocol (P2PP) server, which emulates an IP link over a serial port. To avoid confusion with Precise Point Positioning, this feature is referred to as P2PP in Septentrio receivers. This command configures the P2PP server.

In the current version, the receiver implements a single P2PP server, and the first argument (ServerID) can only take the value P2PP1.

The *Mode* argument enables the P2PP server (it is disabled by default).

Cd sets the COM port to be used for the point-to-point communication. The baud rate and hardware flow control must be configured with the **setCOMSettings** command.

ClientIP sets the IP address that will be given to the client (i.e. your local computer) when a connection is established.

ServerIP sets the IP address that will be given to the server (i.e. the receiver) when a connection is established.

Auth determines whether the client needs to authenticate itself when establishing the connection. PAP will use Password Authentication Protocol and CHAP will use Challenge Handshake Authentication Protocol. When authentication is enabled, the *Password* argument sets the password that will need to be supplied.

ConnectTimeout sets the maximum time, in seconds, that a connection attempt may consume before being refused.

ActivityTimeout sets the maximum time, in seconds, that a connection may be idle (no data transfer) before it is disconnected.

When a timeout occurs, the receiver will shut down the P2PP server and restart it. When a server is enabled, and the configuration is correct, the receiver will start the P2PP server within a maximum of 30 seconds.

```
COM1> sp2p, P2PP1, Off, COM1, 255.255.255.255, 255.255.255.255,
   None, P@ssw0rd1, 60, 600<CR>
$R: sp2p, P2PP1, Off, COM1, 255.255.255.255, 255.255.255.255, None,
   P@ssw0rd1, 60, 600

   None, P@ssw0rd1, 60, 600
COM1>
```

⁽⁴⁾ Only half of the total password length is available to the user (See Section 3.1.4 on page 66)

spfw	setPortFirewall	Interface	OpenPorts	PortList (100)			
gpfw	getPortFirewall	Interface					
		+ Ethernet	none				
		all	<u>default</u>				
			all				
			PortList				

RxControl: Communication > Network Settings > Security

Use this command to configure the receiver firewall, i.e. to specify the list of IP ports which are open to receive data.

The list of open ports can be specified independently for all network interfaces. The default (*OpenPorts* is set to default) depends on the interface, as follows:

Interface	Description
Ethernet	By default, all ports open.

It is possible to close all ports (*OpenPorts* is none), to open all ports (*OpenPorts* is all), or to manually specify a list of ports to open (*OpenPorts* is PortList). In the latter case, the list of port numbers needs to be specified in the *PortList* argument. The different port numbers must be separated by whitespaces. The *PortList* argument is ignored if *OpenPorts* is not set to PortList.

```
COM1> spfw, Ethernet, PortList, "21 80 28784"<CR> $R: spfw, Ethernet, PortList, "21 80 28784"
   PortFirewall, Ethernet, PortList, "21 80 28784"
COM1>
```

3.2.14 NTRIP Settings

snmp	setNtripCasterMountPoints	MountPointID	Enable	MPName (32)	ExtServer	UserName (20)	Password (40/2)	ClientAuth	
gnmp	getNtripCasterMountPoints	MountPointID					(5)		
		+ MP1	off		<u>No</u>			none	
		+ MP2	on		Yes			<u>basic</u>	
		+ MP3							
		all							

RxControl: Communication > NTRIP Settings > NTRIP Caster settings

This command defines the general characteristics of the mount points available on the built-in NTRIP caster. The caster supports up to three mount points.

The *Enable* argument disables or disables a mount point. The *MPName* argument is the mount point name, as it will appear in the stream record of the caster source table. Make sure to give each enabled mount point a different name.

The *ExtServer* argument defines if the mount point is allowed to receive a stream from a remote NTRIP server (argument set to Yes), or if only local streams are allowed, i.e. streams originating from the receiver's own NTRIP server. The *UserName* and *Password* arguments are the credentials needed for the remote server to feed data. These arguments are ignored if *ExtServer* is set to No.

The *ClientAuth* argument defines the mount point client access protection. If set to none, all clients will be able to connect without providing credentials.

Note that the caster is reset each time a setting is changed with this command.

Example

COM1> snmp, MP1, on, MyMP, Yes, MyUser, MyPwd, basic<CR>
\$R: snmp, MP1, on, MyMP, Yes, MyUser, MyPwd, basic
 NtripCasterMountPoints, MP1, on, MyMP, Yes, MyUser, MyPwd, basic
COM1>

⁽⁵⁾ Only half of the total password length is available to the user (See Section 3.1.4 on page 66)

smpf	setNtripCasterMPFormat	MountPointID	Format	ManualFt (30)	FtDetails (100)			
gmpf	getNtripCasterMPFormat	MountPointID						
		+ MP1	RTCMv2					
		+ MP2	RTCMv3					
		+ MP3	CMR					
		all	NMEA					
			RAW					
			manual					

RxControl: Communication > NTRIP Settings > NTRIP Caster settings

Use this command to define the format of the streams available on the caster mount points.

The Format argument defines the stream format, as will be reported in the <format> field of the sourcetable STR records. It is possible to select one of the predefined formats, or to enter a user-defined format. The latter is done by setting the Format argument to manual and by providing the format string with the ManualFt argument. The ManualFt argument is ignored when Format is not set to manual.

The FtDetails argument sets the contents of the <format-details> field of the sourcetable STR records.

When you need a comma in the ManualFt or FtDetails argument, use the "%%CM" escape sequence. Do not forget to enclose the string between double quotes if it contains whitespaces.

Note that the caster is reset each time a stream format is changed with this command.

When feeding a stream to the caster, make sure that the format of the stream corresponds to the settings in this command.

```
COM1> smpf, MP1, manual, RAW%%CMNMEA, "SBF (1s)%%CM NMEA (5s)"<CR>
$R: smpf, MP1, manual, RAW%%CMNMEA, "SBF (1s)%%CM NMEA (5s)"
 NtripCasterMPFormat, MP1, manual, RAW%%CMNMEA, "SBF (1s)%%CM NMEA
      (5s)"
COM1>
```

		Mode	Port	Identifier (100)	TlsPort			
gncs	getNtripCasterSettings							
		off on	0 <u>2101</u> 65535	<u>default</u>	0 <u>2102</u> 65535			

RxControl: Communication > NTRIP Settings > NTRIP Caster settings

Use this command to enable and configure the built-in NTRIP caster.

The *Port* argument specifies on which IP port the caster can be accessed in plaintext (unencrypted) mode, and the *TlsPort* specifies on which TLS port the caster can be accessed. The TLS certificate is the same as the HTTPS certificate. See the **setHttpsSettings** command for details.

Note that, if *Port* and *TlsPort* are equal, TLS is disabled.

The *Identifier* argument is a free text that can be used to describe the caster. If *Identifier* is set to the string "default", it is replaced by the receiver name and serial number. This text will appear in the "Identifier" field of the caster record in the NTRIP source table.

```
COM1> sncs, on, 2101, default, 2102<CR>
$R: sncs, on, 2101, default, 2102
  NtripCasterSettings, on, 2101, default, 2102
COM1>
```

	•		UserName (20)	, ,	MountPoints	MaxClients		
gncu	getNtripCasterUsers	UserID		(6)				
		+ User1			none	1 <u>10</u>		
		+ User2			+ MP1			
		+ User3			+ MP2			
		+ User4			+ MP3			
		+ User5			all			
		all						

RxControl: Communication > NTRIP Settings > NTRIP Caster settings

This command defines the user accounts (user name and password) that clients can use to connect to the built-in NTRIP caster. The password must contain at least one character (empty passwords are not supported). Up to five user accounts can be defined.

The *MountPoints* argument defines the list of mount points allowed for a given user account.

The caster can accept up to 10 concurrent client connections in total. The *MaxClients* argument can be used to limit the number of clients that are allowed to concurrently connect using a particular account.

To delete a user account, enter this command with an empty *UserName* argument.

Note that the caster is reset each time a user account is added, deleted or modified with this command.

```
COM1> sncu, User1, MyUser, MyPwd, all, 1<CR>
$R: sncu, User1, MyUser, MyPwd, all, 1
  NtripCasterUsers, User1, MyUser, MyPwd, all, 1

sntg	setNtripGeneralSettings	UserAgent (64)				
gntg	getNtripGeneralSettings					
		<u>default</u>				

RxControl: Communication > NTRIP Settings > NTRIP Server/Client settings

This command defines the general characteristics of the Server/Client NTRIP connections.

The *UserAgent* argument is a free text for forming the User-Agent used in the HTTP(S) headers of the NTRIP connections. The actual User-Agent string has the form "NTRIP <*UserAgent*>/<version>". If *UserAgent* is set to the string "default", it is replaced with the receiver name.

```
COM1> sntg, "default"<CR>
$R: sntg, "default"
   NtripGeneralSettings, "default"
COM1>
```

snts	setNtripSettings	Cd	Mode	Caster (40)	Port	UserName (20)	Password (64/2)	MountPoint (32)	Version	SendGGA
gnts	getNtripSettings	Cd					(7)			
		+NTR1	<u>off</u>		0 <u>2101</u>				v1	<u>auto</u>
		+ NTR2	Server		65535				<u>v2</u>	off
		+NTR3	Client							sec1
		+NTR4								sec5
		all								sec10
										sec60

RxControl: Communication > NTRIP Settings > NTRIP Server/Client settings

Use this command to specify the parameters of the NTRIP connection referenced by the *Cd* argument.

The *Mode* argument specifies the type of NTRIP connection. In Server mode, the receiver is sending data to an NTRIP caster. In Client mode, the receiver gets data from the NTRIP caster. Set *Mode* to off to disable the connection.

Caster is the hostname or IP address of the NTRIP caster to connect to. To send data to the built-in NTRIP caster, use "localhost" for the Caster argument. Port, UserName, Password and MountPoint are the IP port number, the user name, the password and the mount point to be used when connecting to the NTRIP caster. The default NTRIP port number is 2101. Note that the receiver encrypts the password so that it cannot be read back with the command getNtripSettings.

The Version argument specifies which version of the NTRIP protocol to use (v1 or v2).

The SendGGA argument specifies whether or not to send NMEA GGA messages to the NTRIP caster, and at which rate. In auto mode (the default), the receiver automatically sends GGA messages if requested by the caster. This argument is ignored in NTRIP server mode.

```
COM1> snts, NTR1, Client, ntrip.com, 2101, USER, PWD, MP1, v2,
   auto<CR>
$R: snts, NTR1, Client, ntrip.com, 2101, USER, PWD, MP1, v2, auto
   NtripSettings, NTR1, Client, ntrip.com, 2101, USER, PWD, MP1, v2,
   auto
COM1>
```

⁽⁷⁾ Only half of the total password length is available to the user (See Section 3.1.4 on page 66)

Inst	IstNTRIPSourceTable	Caster (40)	Port				
			0 <u>2101</u> 65535				

Use this command to retrieve the source table from the specified NTRIP caster.

Caster is the hostname or IP address of the NTRIP caster to connect to, and *Port* is the IP port number. The default NTRIP port number is 2101.

```
COM1> Inst, ntripcaster <CR>
$R; lnst, ntripcaster
---->
$-- BLOCK 1 / 0 C
HTTP/1.1 200 OK
Ntrip-Version: Ntrip/2.0
Ntrip-Flags: st_filter, st_auth, st_match, st_strict

sntt	setNtripTlsSettings	Cd	Enable	Fingerprint (96)			
gntt	getNtripTlsSettings	Cd					
		+NTR1	<u>off</u>				
		+ NTR2	on				
		+ NTR3					
		+ NTR4					
		all					

RxControl: Communication > NTRIP Settings > NTRIP Server/Client settings

Use this command to enable or disable TLS on the NTRIP connection referenced by the *Cd* argument.

If the caster's certificate is known by a publicly-trusted certification authority (CA), the receiver will authenticate it by following the usual CA chain of trust, starting from root certificates present on the receiver. In that case, the *Fingerprint* argument should be left empty. If the NTRIP caster uses a self-signed certificate or a certificate only known by a private CA, its SHA-256 fingerprint must be provided. The self-signed certificate of the built-in caster (localhost) is present in the trust-zone of the receiver, and so the *Fingerprint* argument can be left empty for NTRIP client or server connections to localhost.

The examples below show different formats for the *Fingerprint* argument.

Examples

```
COM1> sntt, NTR1, on, ""<CR>
$R: sntt, NTR1, on, ""
  NtripTlsSettings, NTR1, on, ""
COM1>
```

Lower and upper case characters are allowed:

```
COM1> sntt, NTR1, on, Aa:Bb:56:78:90:12: ... 78:90:12:34 <CR> $R: sntt, NTR1, on, Aa:Bb:56:78:90:12: ... 78:90:12:34  
   NtripTlsSettings, NTR1, on, "AA:BB:56:78:90:12: ... 78:90:12:34"  
COM1>
```

When using whitespaces as delimiter, do not forget to enclose the fingerprint in double quotes:

```
COM1> sntt, NTR1, on, "Aa Bb 56 78 90 12 ... 78 90 12 34" <CR> $R: sntt, NTR1, on, "Aa Bb 56 78 90 12 ... 78 90 12 34"  
NtripTlsSettings, NTR1, on, "AA:BB:56:78:90:12: ... 78:90:12:34"  
COM1>
```

It is also allowed to leave out the delimiters in the fingerprint:

```
COM1> sntt, NTR1, on, AaBb56789012 ... 78901234 <CR>
$R: sntt, NTR1, on, AaBb56789012 ... 78901234
  NtripTlsSettings, NTR1, on, "AA:BB:56:78:90:12: ... 78:90:12:34"
COM1>
```

RxControl: Communication > Output Settings > NMEA Output Once

Use this command to output a set of NMEA messages on a given connection. This command differs from the related **setNMEAOutput** command in that it instructs the receiver to output the specified messages only once, instead of at regular intervals.

The *Cd* argument defines the connection descriptor (see 1.2.5) on which the message(s) should be output and the *Messages* argument defines the list of messages that should be output. Refer to appendix C for a short description of the NMEA sentences.

Please make sure that the connection specified by *Cd* is configured to allow NMEA output (this is the default for all connections). See the **setDataInOut** command.

Example

To output the receiver position on COM1, use:

COM1> enoc, COM1, GGA <CR>
\$R: enoc, COM1, GGA
 NMEAOnce, COM1, GGA
COM1>

sno	setNMEAOutput	Stream	Cd	Messages	Interval			
gno	getNMEAOutput	Stream

RxControl: Communication > Output Settings > NMEA Output > NMEA Output Intervals

Use this command to output a set of NMEA messages on a given connection at a regular interval. The *Cd* argument defines the connection descriptor (see 1.2.5) on which the message(s) should be output and the *Messages* argument defines the list of messages that should be output. Refer to appendix C for a short description of the NMEA sentences.

This command is the counterpart of the **setSBFOutput** command for NMEA sentences. Please refer to the description of that command for a description of the arguments.

Examples

To output GGA at 1Hz and RMC at 10Hz on COM1, use:

```
COM1> sno, Stream1, COM1, GGA, sec1 <CR>
$R: sno, Stream1, COM1, GGA, sec1
   NMEAOutput, Stream1, COM1, GGA, sec1
COM1> sno, Stream2, COM1, RMC, msec100 <CR>
$R: sno, Stream2, COM1, RMC, msec100
   NMEAOutput, Stream2, COM1, RMC, msec100
COM1>
```

To get the list of NMEA messages currently output, use:

```
COM1> gno <CR>
$R: gno
   NMEAOutput, Stream1, COM1, GGA, sec1
```

```
NMEAOutput, Stream2, COM1, RMC, msec100
NMEAOutput, Stream3, none, none, off
NMEAOutput, Stream4, none, none, off
NMEAOutput, Stream5, none, none, off
NMEAOutput, Stream6, none, none, off
NMEAOutput, Stream7, none, none, off
NMEAOutput, Stream8, none, none, off
NMEAOutput, Stream9, none, none, off
NMEAOutput, Stream9, none, none, off
NMEAOutput, Stream10, none, none, off
COM1>
```

snp	setNMEAPrecision	NrExtraDigits	Compatibility	LocalDatum	MinStdDev			
gnp	getNMEAPrecision							
				<u>off</u>	0.000 <u>0.001</u> 1.000 m			
			Mode1	only				
			Mode2					

RxControl: Communication > Output Settings > NMEA Output > Customize

Use these commands to define/inquire the number of extra digits in the latitude, longitude and altitude reported in NMEA sentences and to tune certain sentences to be compatible with third-party applications that are not fully compliant with the NMEA 0183 standard.

When *NrExtraDigits* is 0, the latitude and longitude are reported in degrees with 5 decimal digit, and altitude is reported in meters with 2 decimal digit. These default numbers of digits lead to a centimeter-level resolution of the position. To represent RTK positions with their full precision (millimeter-level), it is recommended to set *NrExtraDigits* to 2.

Note that increasing the number of digits (setting *NrExtraDigits* to a non-zero value) may cause the NMEA standard to be broken, as the total number of characters in a sentence may end up exceeding the prescribed limit of 82.

When setting the argument *Compatibility* to <code>Mode1</code>, the GPS Quality Indicator in GGA sentences is set to the value "2: Differential GPS" for all non-standalone positioning modes, the Mode Indicator in GNS sentences is set to "D: Differential" for all non-standalone positioning modes, and the Course Over Ground in the VTG sentences is not a null field for stationary receivers.

When setting the argument Compatibility to Mode2, the Course Over Ground in the VTG sentences is not a null field for stationary receivers.

The LocalDatum argument specifies whether transformation parameters sent out by the RTK service provider should be applied or not in NMEA sentences GGA and GNS. If LocalDatum is off, the transformation parameters are not applied, and the coordinates in GGA and GNS correspond to the coordinates in the PVTGeodetic SBF block. If LocalDatum is only and the relevant transformation parameters have been received, the coordinates are transformed to the local datum and correspond to the Poslocal SBF block. If the transformation parameters are not available, the coordinates are untransformed (in particular, the datum setting of the setGeodeticDatum command has no effect). The TFM proprietary NMEA sentence can be used to determine which transformation has been applied.

The *MinStdDev* argument defines the minimum standard deviation values that can be encoded in the GST sentence. If an actual standard deviation is below the value provided in *MinStdDev*, the value in *MinStdDev* is encoded instead.

```
COM1> snp, 2, Mode2, off, 0.05<CR>
$R: snp, 2, Mode2, off, 0.05
   NMEAPrecision, 2, Mode2, off, 0.050
COM1>
```

snti	setNMEATalkerID	TalkerID				
gnti	getNMEATalkerID					
		auto				
		<u>GP</u>				
		GN				

RxControl: Communication > Output Settings > NMEA Output > Customize

Use these commands to define/inquire the "Device Talker" for NMEA sentences. The device talker allows users to identify the type of equipment from which the NMEA sentence was issued.

When the *TalkerID* argument is set to auto, the talker will depend on the type of solution that is output. For a GNSS solution, "GN" is used if satellites from multiple constellations are used, "GP" for a GPS only solution, "GA" for a Galileo only solution, and "GB" for a BeiDou only solution.

Note that the command is ignored for the NMEA sentences where it would conflict with the standard. For example, the GSV sentence reporting the GPS visibility will always have its device talker set to "GP" regardless of the **setnmeatalkerID** command.

Example

COM1> snti, GP <CR>
\$R: snti, GP
 NMEATalkerID, GP
COM1>

snv	setNMEAVersion	Version				
gnv	getNMEAVersion					
		<u>v3x</u>				
		v4x				

RxControl: Communication > Output Settings > NMEA Output > Customize

Use this command to set the NMEA version the receiver should comply with.

If v3x is selected, the NMEA sentences are formatted according to the 3.01 version of the standard. If v4x is selected, system ID, signal ID and navigational status fields are added in some sentences according to version 4.11 of the NMEA standard.

Example

COM1> snv, v4x<CR>
\$R: snv, v4x
 NMEAVersion, v4x
COM1>

3.2.16 SBF Configuration

smrf	setMeas3MaxRefInterval	MaxIntrvl				
gmrf	getMeas3MaxRefInterval					
		OnlyRef				
		msec500				
		sec1				
		sec5				
		sec10				
		sec30				
		sec60				

RxControl: Communication > Output Settings > SBF Output > Customize

Use this command to define at which interval to encode reference epochs (i.e. full measurements) into the Meas 3Ranges SBF block. Refer to the description of the Meas 3Ranges block for a definition of the reference epochs.

When generating the Meas 3Ranges SBF block, the receiver automatically selects an optimal interval between reference epochs. This command allows the user to define the maximum interval allowed for his application. Setting the *MaxIntrvl* argument to OnlyRef forces the receiver to only encode reference epochs in Meas 3Ranges. This will allow to decode all epochs independently of any previous epoch, at the expense of a larger average SBF block size.

Example

COM1> smrf, OnlyRef<CR>
\$R: smrf, OnlyRef
 Meas3MaxRefInterval, OnlyRef
COM1>

RxControl: Communication > Output Settings > SBF Groups

Use these commands to define/inquire user-defined groups of SBF blocks that can be re-used in the **exeSBFOnce** and the **setSBFOutput** commands. The purpose of defining groups is to ease the typing effort when the same set of SBF blocks are to be addressed regularly.

The list of supported SBF blocks [SBF List] can be found in appendix B.

A number of predefined groups of SBF blocks are available (such as Measurements). See the command **setSBFOutput** for a description of these predefined groups.

Example

To output the messages MeasEpoch, PVTCartesian and DOP as one group on COM1 at a rate of 1Hz, you could use the following sequence of commands:

```
COM1> ssgp, Group1, MeasEpoch+PVTCartesian+DOP <CR>
$R: ssgp, Group1, MeasEpoch+PVTCartesian+DOP
   SBFGroups, Group1, MeasEpoch+PVTCartesian+DOP

COM1> sso, Stream1, COM1, Group1, sec1 <CR>
$R: sso, Stream1, COM1, Group1, sec1
   SBFOutput, Stream1, COM1, Group1, sec1
COM1>
```

		IPR5	+ Support				

RxControl: Communication > Output Settings > SBF Output Once

Use this command to output a set of SBF blocks on a given connection. This command differs from the related **setSBFOutput** command in that it instructs the receiver to output the specified SBF blocks only once, instead of at regular intervals.

The *Cd* argument defines the connection descriptor (see 1.2.5) on which the message(s) should be output and the *Messages* argument defines the list of messages that should be output. The list of SBF blocks [SBF List] supported by the **exeSBFOnce** command can be found in appendix B.

Make sure that the connection specified by *Cd* is configured to allow SBF output (this is the default for all connections). See also the **setDataInOut** command.

Predefined groups of SBF blocks (such as Measurements) can be addressed in the *Messages* argument. These groups are defined in the table below.

When using this command to output a block that is also scheduled with the **setSBFOutput** command, the block will be sent twice. Note that this can cause duplicate measurement or PVT epochs in the SBF stream.

Messages	Description

RxControl: Communication > Output Settings > SBF Output > SBF Output

Use this command to output a set of SBF blocks on a given connection at a regular interval.

A *Stream* is defined as a list of messages that should be output with the same interval on one connection descriptor (*Cd* - see 1.2.5). In other words, one *Stream* is associated with one *Cd* and one *Interval*, and contains a list of SBF blocks defined by the *Messages* argument.

The list of supported SBF blocks [SBF List] can be found in appendix B.

Predefined groups of SBF blocks (such as Measurements) can be addressed in the *Messages* argument. These groups are defined in the table below.

Messages	Description

The *Interval* argument defines the rate at which the SBF blocks specified in the *Messages* argument are output. If set to off, the SBF blocks are disabled. If set to OnChange, the SBF blocks are output at their natural renewal rate (see section 4.1.8). If a specific interval is specified (e.g. sec1 corresponds to an interval of 1 second), the SBF blocks are decimated from their renewal rate to the specified interval. Some blocks can only be output at their renewal rate (e.g. the GPSNav block). For these blocks, the receiver ignores the value of the *Interval* argument and always assumes OnChange. The list of those blocks can be found in appendix B (see the "Flex Rate" column).

Please make sure that the connection specified by *Cd* is configured to allow SBF output (this is the default for all connections). See the **setDataInOut** command.

Res1 to Res4 are reserved values of *Stream*. These streams are not saved in the configuration files and, as a consequence, they will always be reset at boot time. For most users, it is not recommended to use these streams.

Example

To output the MeasEpoch block at 10Hz and the PVTGeodetic block at 1Hz on COM1, use the following sequence:

```
COM1> sso, Stream1, COM1, MeasEpoch, msec100 <CR>
$R: sso, Stream1, COM1, MeasEpoch, msec100
   SBFOutput, Stream1, COM1, MeasEpoch, msec100
COM1> sso, Stream2, COM1, PVTGeodetic, sec1 <CR>
$R: sso, Stream2, COM1, PVTGeodetic, sec1
   SBFOutput, Stream2, COM1, PVTGeodetic, sec1
COM1>
```

3.2.17 RTCM v2.x Settings

sr2c	setRTCMv2Compatibility	PRCType	GLOToD	RTKVersion			
gr2c	getRTCMv2Compatibility						
		<u>Standard</u>	<u>Tk</u>	v2.1			
		GroupDelay	ТЬ	v2.2orLater			

RxControl: Communication > Input Settings > Differential Corrections > RTCMv2

Use these commands to define/inquire the compatibility of the RTCM 2.x input correction stream. This command applies to rover receivers only and should be used in case the available base station correction stream is not fully compatible with the latest version of the RTCM 2.x standard.

The *PRCType* argument is used to handle a difference in the interpretation of DGNSS corrections between the version 2.0 of the RTCM standard and later versions. If the base station is sending RTCM Message Type 1 based on version 2.0, the value <code>GroupDelay</code> must be selected to have a correct usage of incoming corrections.

The *GLOToD* argument specifies how to interpret the time-of-day field in the differential GLONASS correction message (MT31). Select ${\tt Tb}$ to be compatible with RTCM version up to 2.2, and select ${\tt Tk}$ to be compatible with RTCM 2.3 and later.

The *RTKVersion* argument specifies if the base station encodes RTK correction messages (MT18 to MT21) according to version 2.1 of the RTCM standard, or according to version 2.2 or above.

Example

To make to rover receiver compatible with a base station sending RTCM 2.2 corrections, use:

```
COM1> sr2c, , Tb <CR>
$R: sr2c, , Tb
   RTCMv2Compatibility, Standard, Tb, v2.2orLater
COM1>
```

sr2h	setRTCMv2EphemerisHoldoff	TimeGPS	TimeGLO				
gr2h	getRTCMv2EphemerisHoldoff						
		<u>0</u> 300 s	<u>0</u> 300 s				

RxControl: Communication > Output Settings > Differential Corrections > RTCMv2

This command specifies the delay in applying new navigation data sets when generating differential GPS and GLONASS correction messages such as MT1 and MT31.

The delay can be set independently for GPS and GLONASS satellites with the *TimeGPS* and *TimeGLO* arguments.

Upon reception of a new navigation data set from GPS(GLONASS) satellites (IOD change), the differential corrections continue to refer to the previous data set for *TimeGPS(TimeGLO)* seconds.

```
COM1> sr2h, 60, 0<CR>
$R: sr2h, 60, 0
  RTCMv2EphemerisHoldoff, 60, 0
COM1>
```

setRTCMv2Formatting getRTCMv2Formatting	ReferenceID	GLOToD				
	<u>0</u> 1023	Tk Tb				

RxControl: Communication > Output Settings > Differential Corrections > RTCMv2

Use these commands to define/inquire the reference station ID assigned to the receiver when operating in base station mode. The reference station ID is transmitted in the first word of each outgoing RTCM v2.x message.

The argument *GLOToD* specifies how to encode the time-of-day field in the differential GLONASS correction message (MT31). Select ${\tt Tb}$ to be compatible with RTCM version up to 2.2, and select ${\tt Tk}$ to be compatible with RTCM 2.3 and later.

```
COM1> sr2f, 345 <CR>
$R: sr2f, 345
  RTCMv2Formatting, 345, Tk
COM1>

COM1> gr2f <CR>
$R: gr2f
  RTCMv2Formatting, 345, Tk
COM1>
```

sr2i	setRTCMv2Interval	Message	ZCount				
gr2i	getRTCMv2Interval	Message					
		+ RTCM1	1 <u>2</u> 1000				
		+ RTCM3					
		+ RTCM9					
		+RTCM16					
		+RTCM17					
		+ RTCM22					
		+ RTCM23 24					
		+ RTCM31					
		+ RTCM32					
		all					

RxControl: Communication > Output Settings > Differential Corrections > RTCMv2

Use these commands to define/inquire at which interval the RTCM v2.x messages specified in the *Message* argument should be generated. The related **setRTCMv2IntervalObs** command must be used to specify the interval of some RTK-related messages such as messages 18 and 19.

The interval for every message is given in the *ZCount* argument, in units of 0.6 seconds. For example, to generate a message every 6 seconds, *ZCount* should be set to 10.

For the ephemerides message (RTCM17), the ephemerides are sent out one satellite at a time, at a rate specified by this command. For instance, if *ZCount* is set to 1 and there are 12 ephemerides to send out, it takes 0.6*12=7.2 seconds to send the whole ephemerides set.

The intervals specified with this command are not connection-specific: all the connections which output a given RTCM v2.x message will output it with the same interval.

Note that this command only defines the interval of RTCM messages. To make the receiver actually output these messages, use the **setRTCMv2Output** and **setDataInOut** commands.

Refer to appendix D for an overview of the supported RTCM v2.x messages.

```
COM1> sr2i, RTCM22, 15 <CR>
$R: sr2i, RTCM22, 15
  RTCMv2Interval, RTCM22, 15
COM1>

sr2b	setRTCMv2IntervalObs	Message	Interval				
gr2b	getRTCMv2IntervalObs	Message					
		+ RTCM18 19	<u>1</u> 600 s				
		+ RTCM20 21					
		all					

RxControl: Communication > Output Settings > Differential Corrections > RTCMv2

Use these commands to define/inquire at which interval the RTCM v2.x messages specified in the *Message* argument should be generated. The related **setRTCMv2Interval** command must be used to specify the interval of other supported RCTCM v2.x messages.

The intervals specified with this command are not connection-specific: all the connections which output a given RTCM v2.x message will output it with the same interval.

Note that this command only defines the interval of RTCM messages. To make the receiver actually output these messages, use the **setRTCMv2Output** and **setDataInOut** commands.

Examples

```
COM1> sr2b, RTCM20|21, 2 <CR>
$R: sr2b, RTCM20|21, 2
  RTCMv2IntervalObs, RTCM20|21, 2
COM1>

COM1> gr2b <CR>
$R: gr2b
  RTCMv2IntervalObs, RTCM18|19, 1
  RTCMv2IntervalObs, RTCM20|21, 2
COM1>
```

sr2m	setRTCMv2Message16	Message (90)				
gr2m	getRTCMv2Message16					
		<u>Unknown</u>				

Use these commands to define/inquire the string that will be transmitted in the RTCM v2.x message 16. The argument *Message* can contain up to 90 characters.

Note that this command only defines the content of message 16. To make the receiver actually output this message, use the **setRTCMv2Output** and **setDataInOut** commands.

Example

To send the string "Hello" in message 16 over COM2 at the default interval, use the following sequence:

COM1> sr2m, Hello <CR>
\$R: sr2m, Hello
RTCMv2Message16, "Hello"

COM1> sr2o, COM2, RTCM16 <CR>
\$R: sr2o, COM2, RTCM16
RTCMv2Output, COM2, RTCM16

COM1> sdio, COM2, RTCMv2 <CR>
\$R: sdio, COM2, RTCMv2
DataInOut, COM2, auto, RTCMv2

COM1>

sr2o	setRTCMv2Output	Cd	Messages				
gr2o	getRTCMv2Output	Cd					
		+ COM1	none				
		+ COM2	+ RTCM1				
		+ COM3	+ RTCM3				
		+ COM4	+ RTCM9				
		+ USB1	+RTCM16				
		+ USB2	+ RTCM18 19				
		+ IP10 IP17	+ RTCM20 21				
		+NTR1	+ RTCM22				
		+NTR2	+ RTCM23 24				
		+NTR3	+ RTCM31				
		+NTR4	+ RTCM32				
		+ IPS1	+RTCM17				
		+ IPS2	+ DGPS				
		+ IPS3	+RTK				
		+ IPS4	all				
		+ IPS5					
		+ IPR1					
		+ IPR2					
		+ IPR3					
		+ IPR4					
		+ IPR5					
		all					

Use these commands to define/inquire which RTCM v2.x messages are enabled for output on a given connection descriptor (Cd - see 1.2.5). The *Messages* argument specifies the RTCM message types to be enabled. Some pairs of messages are always enabled together, such as messages 18 and 19. DGPS is an alias for "RTCM1+RTCM3+RTCM31" and RTK is an alias for "RTCM3+RTCM18 | 19+RTCM22+RTCM31".

Refer to appendix D for an overview of the supported RTCM v2.x messages.

Please make sure that the connection specified by *Cd* is configured to allow RTCMv2 output, which can be done with the **setDataInOut** command. The interval at which each message is output is to be specified with the **setRTCMv2Interval** or the **setRTCMv2IntervalObs** command.

Example

To enable RTCM v2.x messages 3, 18, 19 and 22 on COM2, use the following sequence:

```
COM1> sr2o, COM2, RTCM3+RTCM18|19+RTCM22 <CR>
$R: sr2o, COM2, RTCM3+RTCM18|19+RTCM22
  RTCMv2Output, COM2, RTCM3+RTCM18|19+RTCM22
COM1> sdio, COM2, , RTCMv2 <CR>
$R: sdio, COM2, , RTCMv2
  DataInOut, COM2, auto, RTCMv2
COM1>
```

sr2u	setRTCMv2Usage	MsgUsage				
gr2u	getRTCMv2Usage					
		none				
		+ RTCM1				
		+ RTCM3				
		+ RTCM9				
		+RTCM15				
		+ RTCM18 19				
		+ RTCM20 21				
		+ RTCM22				
		+ RTCM23 24				
		+ RTCM31				
		+ RTCM32				
		+ RTCM34				
		+ RTCM17				
		+ RTCM59				
		all				

Use this command to restrict the list of incoming RTCM v2.x messages that the receiver is allowed to use in its differential PVT computation.

A short description of the supported RTCM v2.x messages can be found in appendix D.

Example

To only accept RTCM1 and RTCM3 corrections from the base station 1011, use the following sequence:

```
COM1> sr2u, RTCM1+RTCM3 <CR>
$R: sr2u, RTCM1+RTCM3
  RTCMv2Usage, RTCM1+RTCM3

COM1> sdcu, , , manual, 1011 <CR>
$R: sdcu, , , manual, 1011
  DiffCorrUsage, LowLatency, 3600.0, manual, 1011 ...
COM1>
```

3.2.18 RTCM v3.x Settings

setRTCMv3CRSTransfo getRTCMv3CRSTransfo	Mode	TargetName (32)				
	auto manual					

RxControl: Communication > Input Settings > Differential Corrections > RTCMv3

Use this command to specify how to apply the coordinate reference system (CRS) transformation parameters contained in RTCM v3.x message types 1021 to 1023.

In auto mode (the default), the receiver decodes and applies the coordinate transformation parameters from message types 1021-1023. If your RTK provider sends transformation parameters for more than one target CRS, the receiver selects the first transformation parameters it receives.

In manual mode, you can force the receiver to only apply the transformation to the target CRS specified with the second argument. The *TargetName* argument must exactly match the name used by the RTK provider. The available target datum names can be found in the RTCMDatum SBF block.

Example

To force using the target CRS identified as "4258" by the RTK network, use:

```
COM1> sr3t, manual, "4258"<CR>
$R: sr3t, manual, "4258"
  RTCMv3CRSTransfo, manual, "4258"
COM1>
```

sr3d	setRTCMv3Delay	Delay				
gr3d	getRTCMv3Delay					
		<u>0.0</u> 600.0 s				

Use this command to instruct the receiver to generate and output RTCM v3.x messages with a certain delay.

It is possible to impose a global delay to all RTCM v3.x messages by setting the *Delay* to a nonzero value. This can be used in situations where multiple base stations must be configured to transmit their corrections in a time-multiplexed way. For example, base station A would compute and transmit its corrections at every 10-second epoch (in the GPS time scale), and base station B would compute and transmit its corrections 5 seconds after the 10-second epochs. In that case, receiver B would be configured with the *Delay* argument set to 5.

See also the **setRTCMv3Interval** command to configure the message interval.

Example

To generate the RTCM1001 message with an interval of 10 seconds and a time shift of 2 seconds, use:

```
COM1> sr3i, RTCM1001|2, 10 <CR>
$R: sr3i, RTCM1001|2, 10
   RTCMv3Interval, RTCM1001|2, 10
COM1> sr3d, 2 <CR>
$R: sr3d, 2
   RTCMv3Delay, 2
COM1>
```

sr3f	setRTCMv3Formatting	ReferenceID	MSMSignals	GLOL2	RxType (32)	MaxMSMSats		
gr3f	getRTCMv3Formatting							
		<u>0</u> 4095	+ GPSL1CA	L2CA	<u>default</u>	1 <u>128</u>		
			+ GPSL1PY	L2P				
			+ GPSL2PY					
			+ GPSL2C					
			+ GPSL5					
			+GLOL1CA					
			+ GLOL2P					
			+GLOL2CA					
			+ GLOL3					
			+ GALE1BC					
			+ GALE6BC					
			+ GALE5a					
			+ GALE5b					
			+ GALE5					
			+ GEOL1					
			+ GEOL5					
			+BDSB1I					
			+BDSB2I					
			+ BDSB3I					
			+BDSB1C					
			+ BDSB2a					
			+ BDSB2b					
			+ QZSL1CA					
			+ QZSL2C					
			+ QZSL5					
			+ NAVICL5					
			all					

Use these commands to configure the RTCM v3.x message contents when operating in base station mode.

The $\it Reference ID$ argument specifies the reference station ID transmitted in the header of each outgoing RTCM v3.x message.

The MSMSignals argument specifies the signal types to be encoded in MSM messages. For an observable to be actually encoded in MSM, the corresponding signal type must be enabled with this command, the signal must be enabled for tracking (see the **setSignalTracking** command), and a suitable MSM message must be enabled with the **setRTCMv3Output** command.

The *MaxMSMSats* argument specifies the maximum number of satellites to be encoded in the MSM messages of the same epoch.

The *GLOL2* argument applies to message types 1011 and 1012 (GLONASS L1 and L2 observables). It specifies which of the L2P or the L2CA observables must be encoded in RTCM1011 and RTCM1012.

The *RxType* argument can be used to change the receiver type that is transmitted in message 1033, i.e. to change the way the receiver identifies itself to the RTCM network. Setting *RxType* to "default" reverts to the default receiver type.

Example

COM1> sr3f, 345,
 GPSL1CA+GPSL2PY+GLOL1CA+GLOL2CA+GALE1BC+GALE5b+BDSB1I+BDSB3I,
 L2CA, default, 28<CR>

\$R: sr3f, 345, GPSL1CA+GPSL2PY+GLOL1CA+GLOL2CA+GALE1BC+GALE5b+
BDSB1I+BDSB3I, L2CA, default, 28
RTCMv3Formatting, 345, GPSL1CA+GPSL2PY+GLOL1CA+GLOL2CA+GALE1BC+
GALE5b+BDSB1I+BDSB3I, L2CA, default, 28
COM1>

sr3i	setRTCMv3Interval	Message	Interval				
gr3i	getRTCMv3Interval	Message					
		+RTCM1001 2	0.1 <u>1.0</u>				
		+ RTCM1003 4	600.0 s				
		+ RTCM1005 6					
		+ RTCM1007 8					
		+ RTCM1009 10					
		+RTCM1011 12					
		+ RTCM1013					
		+ RTCM1019					
		+ RTCM1020					
		+ RTCM1029					
		+ RTCM1033					
		+ RTCM1041					
		+ RTCM1042					
		+ RTCM1044					
		+ RTCM1045					
		+ RTCM1046					
		+ RTCM1230					
		+ MSM1 MSM7					
		all					

Use these commands to define/inquire at which interval RTCM v3.x messages should be generated.

The intervals specified with this command are not connection-specific: all the connections which output a given RTCM v3.x message will output it with the same interval.

Using \mathtt{MSMi} for the *Message* argument sets the interval of all Multiple Signal Messages of type \mathtt{i} . Refer to appendix D for an overview of the supported RTCM v3.x messages.

For the ephemerides messages (e.g. RTCM1019), the ephemerides are sent out one satellite at a time, at a rate specified by this command. For instance, if *Interval* is set to 1 and there are 12 GPS ephemerides to send out, it takes 12 seconds to send the whole GPS ephemerides set.

By default, RTCM v3.x messages are generated at integer multiples of the specified interval in the GPS time scale. The command **setRTCMv3Delay** can be used to introduce a time offset.

Note that this command only defines the interval of RTCM messages. To make the receiver actually output these messages, use the **setRTCMv3Output** and **setDataInOut** commands.

Example

```
COM1> sr3i, RTCM1001|2, 2 <CR>
$R: sr3i, RTCM1001|2, 2
   RTCMv3Interval, RTCM1001|2, 2
COM1>
```

sr3m	setRTCMv3Message1029	Message (120)				
gr3m	getRTCMv3Message1029					
		<u>Unknown</u>				

Use these commands to define/inquire the string that will be transmitted in the RTCM v3.x message 1029. The argument *Message* can contain up to 120 characters.

Note that this command only defines the content of message 1029. To make the receiver actually output this message, use the **setRTCMv3Output** and **setDataInOut** commands.

Example

To send the string "Hello" in message 1029 over COM2 at the default interval, use the following sequence:

COM1> sr3m, Hello <CR>
\$R: sr3m, Hello
 RTCMv3Message1029, "Hello"

COM1> sr3o, COM2, RTCM1029 <CR>
\$R: sr3o, COM2, RTCM1029
 RTCMv3Output, COM2, RTCM1029

COM1> sdio, COM2, RTCMv3 <CR>
\$R: sdio, COM2, RTCMv3
 DataInOut, COM2, auto, RTCMv3

			+ MSM1				
			+ MSM2				
			+ MSM3				
			+ MSM4				
			+ MSM5				
			+ MSM6				
			+ MSM7				
			+ Nav				
			all				

Use these commands to define/inquire which RTCM v3.x messages are enabled for output on a given connection descriptor (*Cd* - see 1.2.5). The *Messages* argument specifies the RTCM message types to be enabled.

A short description of the supported RTCM v3.x message types can be found in appendix D. MSMi enables the Multiple Signal Message - Type i from all constellations. Make sure to disable the legacy observation messages (MT1001-1004 and MT1009-1012) when enabling MSM messages as it is not advised to mix them. Nav enables the Ephemeris Data messages for all constellations (RTCM1019, RTCM1020, ...).

Please make sure that the connection specified by *Cd* is configured to allow RTCMv3 output, which can be done with the **setDataInOut** command. The interval at which each message is output is to be specified with the **setRTCMv3Interval** command.

Example

To enable RTCM v3.x messages 1001, 1002, 1005 and 1006 on COM2, use the following sequence:

```
COM1> sr3o, COM2, RTCM1001+RTCM1002+RTCM1005+RTCM1006 <CR>
$R: sr3o, COM2, RTCM1001+RTCM1002+RTCM1005+RTCM1006
  RTCMv3Output, COM2, RTCM1001+RTCM1002+RTCM1005+RTCM1006
COM1> sdio, COM2, , RTCMv3 <CR>
$R: sdio, COM2, , RTCMv3
  DataInOut, COM2, auto, RTCMv3
COM1>
```

sr3u	setRTCMv3Usage	MsgUsage				
gr3u	getRTCMv3Usage	wsg osuge

		+ <u>RTCM1121</u> <u>RTCM1127</u>				
		+ RTCM1230				
		+ MSM1				
		+ MSM2				
		+ MSM3				
		+ MSM4				
		+ MSM5				
		+ MSM6				
		+ MSM7				
		+ Nav				
		all				

Use this command to restrict the list of incoming RTCM v3.x messages that the receiver is allowed to use in its differential PVT computation.

A short description of the supported RTCM v3.x messages can be found in appendix D. MSMi is an alias to enable the Multiple Signal Message - Type i from all constellations at once. Nav is an alias for all the Ephemeris Data messages (RTCM1019, RTCM1020, ...).

Example

To only accept RTCM1001 and RTCM1002 corrections from the base station 1011, use the following sequence:

```
COM1> sr3u, RTCM1001+RTCM1002 <CR>
$R: sr3u, RTCM1001+RTCM1002
  RTCMv3Usage, RTCM1001+RTCM1002
COM1> sdcu, , , manual, 1011 <CR>
$R: sdcu, , , manual, 1011
  DiffCorrUsage, LowLatency, 3600.0, manual, 1011 ...
COM1>
```

3.2.19 CMR v2.0 Settings

sc2f	setCMRv2Formatting	ReferenceID				
gc2f	getCMRv2Formatting					
		<u>0</u> 31				

RxControl: Communication > Output Settings > Differential Corrections > CMRv2

Use these commands to define/inquire the reference station ID assigned to the receiver when operating in base station mode. The reference station ID is transmitted in the header of each outgoing CMR v2.0 message.

Examples

```
COM1> sc2f, 12 <CR>
$R: sc2f, 12
   CMRv2Formatting, 12
COM1>

COM1> gc2f <CR>
$R: gc2f
   CMRv2Formatting, 12
COM1>
```

sc2i	setCMRv2Interval	Message	Interval				
gc2i	getCMRv2Interval	Message					
		+CMR0	0.1 <u>1.0</u>				
		+CMR1	600.0 s				
		+CMR2					
		+CMR3					
		all					

Use these commands to define/inquire at which interval CMR v2.0 messages should be generated.

The intervals specified with this command are not connection-specific: all the connections which output a given CMR v2.0 message will output it with the same interval.

Note that this command only defines the interval of CMR messages. To make the receiver actually output these messages, use the **setCMRv2Output** and **setDataInOut** commands.

Refer to appendix D for an overview of the supported CMR v2.0 messages.

Examples

```
COM1> sc2i, CMR0, 2 <CR>
$R: sc2i, CMR0, 2
   CMRv2Interval, CMR0, 2
COM1>

COM1> gc2i <CR>
$R: gc2i CMRv2Interval, CMR0, 2
   CMRv2Interval, CMR1, 1 CMRv2Interval, CMR2, 1
COM1>
```

sc2m	setCMRv2Message2	ShortID (8)	LongID (50)	COGO (16)			
gc2m	getCMRv2Message2						
		<u>Unknown</u>	<u>Unknown</u>	<u>Unknown</u>			

Use these commands to define/inquire the strings that will be transmitted in the CMR v2.0 message 2.

The argument *ShortID* is the short station ID. It can contain up to 8 characters in compliance with the CMR standard. If less than 8 characters are defined, the string will be right justified and padded with spaces.

The argument *LongID* is the long station ID. It can contain up to 50 characters in compliance with the CMR standard. If less than 50 characters are defined, the string will be right justified and padded with spaces.

The argument *COGO* is the COGO code. It can contain up to 16 characters in compliance with the CMR standard. If less than 16 characters are defined, the string will be right justified and padded with spaces.

Note that this command only defines the contents of message 2. To make the receiver actually output this message, use the **setCMRv2Output** and **setDataInOut** commands.

Example

To send the string "Hello" as short station ID and send CMR2 messages through COM2, use the following sequence:

```
COM1> sc2m, Hello <CR>
$R: sc2m, Hello
    CMRv2Message2, "Hello", "Unknown", "Unknown"
COM1> sc2o, COM2, CMR2 <CR>
$R: sc2o, COM2, CMR2
    CMRv2Output, COM2, CMR2
COM1> sdio, COM2, CMRv2 <CR>
$R: sdio, COM2, CMRv2
    DataInOut, COM2, auto, CMRv2
COM1>
```

sc2o	setCMRv2Output	Cd	Messages				
gc2o	getCMRv2Output	Cd					
		+ COM1	none				
		+ COM2	+ CMR0				
		+ COM3	+ CMR1				
		+ COM4	+ CMR2				
		+ USB1	+ CMR3				
		+ USB2	all				
		+ IP10 IP17					
		+ NTR1					
		+ NTR2					
		+ NTR3					
		+ NTR4					
		+ IPS1					
		+ IPS2					
		+ IPS3					
		+ IPS4					
		+ IPS5					
		+ IPR1					
		+ IPR2					
		+ IPR3					
		+ IPR4					
		+ IPR5					
		all					

Use these commands to define/inquire which CMR v2.0 messages are enabled for output on a given connection descriptor (*Cd* - see 1.2.5). The *Messages* argument specifies the CMR message types to be enabled. Refer to appendix D for an overview of the supported CMR v2.0 messages.

Please make sure that the connection specified by *Cd* is configured to allow CMRv2 output, which can be done with the **setDataInOut** command. The interval at which each message is output is to be specified with the **setCMRv2Interval** command.

Example

To enable CMR v2.0 message 0 on COM2, use the following sequence:

```
COM1> sc2o, COM2, CMR0 <CR>
$R: sc2o, COM2, CMR0
   CMRv2Output, COM2, CMR0

COM1> sdio, COM2, , CMRv2 <CR>
$R: sdio, COM2, , CMRv2
   DataInOut, COM2, auto, CMRv2
COM1>
```

sc2u	setCMRv2Usage	MsgUsage				
gc2u	getCMRv2Usage					
		none				
		+ CMR0				
		+ CMR1				
		+ CMR2				
		+ <u>CMR3</u>				
		+ CMR0p				
		+ CMR0w				
		all				

Use this command to restrict the list of incoming CMR v2.0 messages that the receiver is allowed to use in its differential PVT computation. CMR0p and CMR0w refer to the CMR+ and CMR-W variants respectively.

A short description of the supported CMR v2.0 messages can be found in appendix D.

Example

To only accept CMR0 from the base station 12, use the following sequence:

```
COM1> sc2u, CMR0 <CR>
$R: sc2u, CMR0
   CMRv2Usage, CMR0

COM1> sdcu, , , manual, 12 <CR>
$R: sdcu, , , manual, 12
   DiffCorrUsage, LowLatency, 3600.0, manual, 12 ...
COM1>
```

3.2.20 Internal Disk Logging

sdfa	setDiskFullAction	Disk	Action				
gdfa	getDiskFullAction	Disk					
		+ DSK1	DeleteOldest				
		all	StopLogging				

RxControl: Logging > Internal Logging Settings > Global Logging Options

Use these commands to define/inquire what the receiver should do when the disk identified by *Disk* is full.

The currently supported actions are as follows:

Action	Description
DeleteOldest	The oldest file on the disk is automatically removed, unless the oldest file is also the current logging file. In that latter case, the logging stops. In incremental file naming mode, if the autoincremented file name already exists, the existing file is overwritten.
StopLogging	All logging activity stops on the specified disk.

Examples

```
COM1> sdfa, DSK1, StopLogging <CR>
$R: sdfa, DSK1, StopLogging
  DiskFullAction, DSK1, StopLogging
COM1>

COM1> gdfa <CR>
$R: gdfa
  DiskFullAction, DSK1, StopLogging
COM1>
```

ldi	IstDiskInfo	Disk	Directory (60)				
		DSK1					
		all					

Use this command to retrieve information about the disk identified by the *Disk* argument. The reply to this command contains the disk size and free space in bytes and the list of all recorded files and directories.

The content of directories is not shown by default. To list the content of a directory, use the second argument to specify the directory name.

Example

sfn	setFileNaming	Cd	NamingType	FileName (20)			
gfn	getFileNaming	Cd					
		+ DSK1	<u>FileName</u>	log			
		all	Incremental				
			IGS15M				
			IGS1H				
			IGS6H				
			IGS24H				

RxControl: Logging > Internal Logging Settings > SBF Logging and Upload

Use these commands to define/inquire the file naming convention for the internal SBF, NMEA or user-message log files.

If NamingType is FileName, the file name is given by the third argument FileName, followed by the extension .sbf, .nma or .ecm for SBF, NMEA and user-message files respectively. User-message files contain messages entered by the command exeEchoMessage prefixed with the GPS week number and time of week in seconds.

If NamingType is Incremental, the file name is given by the first five characters of the File-Name argument (right padded with "_" if necessary), followed by a modulo-1000 counter incrementing each time logging is stopped and restarted. The file name extension is .sbf, .nma or .ecm as described above. If the auto-incremented file name already exists on the disk, the receiver takes action as specified by the **setDiskFullAction** command.

The set of allowed characters for the FileName argument is:

_0123456789ABCDEFGHIJKLMNOPQRSTUVWXYZabcdefqhijklmnopqrstuvwxyz

If NamingType is IGS15M, IGS1H, IGS6H or IGS24H, the receiver automatically creates a new file every 15 minutes, every hour, every 6 hours or every 24 hours respectively, and the file name adheres to the IGS/RINEX2.11 naming convention.

The 4-character station identifier is the first four letters of the station code as set by the **setMarkerParameters** command. If the station code is empty, the first four letters of the marker name are used.

If desired, it is also possible to add a log session ID prefix to all file names logged in IGS naming mode. This is enabled with the **setGlobalFileNamingOptions** command.

In IGS naming mode, the files are put in daily directories, the directory name being of the form <code>yyddd</code> with <code>yy</code> the 2-digit year and <code>ddd</code> the day of year. If <code>NamingType</code> is <code>FileName</code> or <code>Incremental</code>, the file is put in the root directory.

Note that the actual file name on the disk is case insensitive and only contains lower-case characters even if the user entered upper-case characters in the *FileName* argument.

If the naming convention is changed while logging is ongoing, the current file is closed and the logging continues in a new file with the name as specified.

Example

To have a fixed file name "mytest.sbf", use:

COM1> sfn, DSK1, FileName, mytest <CR>
\$R: sfn, DSK1, FileName, mytest

FileNaming, DSK1, FileName, "mytest"
COM1>

setGlobalFileNamingOptions getGlobalFileNamingOptions	BusyTag				
	off				
	<u>on</u>				

RxControl: Logging > Internal Logging Settings > Global Logging Options

By default, files names follow the convention described with the logging commands (setFileNaming, setRINEXLogging).

By setting the BusyTag argument to on, a ".A" suffix is added to all files that are currently written to for easy identification. The suffix is removed when the file is closed.

Example

COM1> sfno, on<CR>
\$R: sfno, on
 GlobalFileNamingOptions, on
COM1>

emd	exeManageDisk	Disk	Action				
gmd	getManageDisk						
		DSK1	<u>Unmount</u>				
			Mount				
			Format				

RxControl: Logging > Disk(s) > Disk Management

Use this command to manage the disk identified by the *Disk* argument.

Specify the action Format to format the disk (all data will be lost).

The Mount and Unmount actions mount and unmount the disk respectively. Unmounting an internal disk makes it available as a mass-storage device when the USB cable is connected to a PC, i.e. it makes the disk appear as a drive on most file browsers. When the disk is mounted, it cannot be accessed as a mass-storage device. Internal logging is only possible when the disk is mounted. See the **setUMSDOnConnect** command to automatically unmount the disk upon connecting the USB cable.

Prior to formatting or unmounting the disk, make sure to stop all disk activities. If the specified action could not be performed, an error message is returned.

Example

To format the first disk (DSK1), use:

```
COM1> emd, DSK1, Format <CR>
    $R: emd, DSK1, Format
    ManageDisk, DSK1, Format
    COM1>
```

lrf	IstRecordedFile	Disk	FileName (60)				
		DSK1					

Use this command to retrieve the contents of one of the log files on the disk identified with the *Disk* argument.

The reply to this command consists in a succession of blocks starting with the "\$-- BLOCK" header, and terminating with the pseudo-prompt "---->" (see section Section 3.1.3, "Command Replies" for details). The decoding program must remove these headers and pseudo-prompts to recover the original file contents.

The download speed is highly influenced by the processor load. To speed up the download, it is recommended to stop the signal tracking, which can be done by typing the following command before starting the download: **setSatelliteTracking**, **none**.

The file download can be interrupted by sending ten uppercase "S" characters (simply by holding the "shift-S" key pressed) to the connection through which the download is taking place.

Examples

To output the contents of the internal log file named log.sbf on the first disk (DSK1), use:

```
COM1> lrf, DSK1, log.sbf <CR>
$R; lrf, DSK1, log.sbf
... Here comes the content of log.sbf ...
COM1>
```

If the file log.sbf does not exist, an error is returned:

```
COM1> lrf, DSK1, log.sbf <CR>
$R? lstRecordedFile: Argument 'FileName' could not be handled!
COM1>
```

erf	exeRemoveFile	Disk	FileName (200)				
grf	getRemoveFile						
		DSK1	none				
			all				

RxControl: Logging > Remove Internal File

Use this command to remove one file or an entire directory (if your receiver supports directories, see for example IGS file naming mode (see the **setFileNaming** command)) from the disk identified by the *Disk* argument.

If *FileName* is the name of a file, only that single file is removed from the disk. Files in a directory can be specified using dirname/filename when supported.

If *FileName* is the name of a directory, the entire directory is deleted, except the file currently written to, if any.

If the reserved string all is used for the *FileName* argument, all files are removed from the selected disk, except the file currently written to, if any.

If there is no file nor directory named *FileName* on the disk or if the file is currently written to, an error message is returned.

Examples

To remove the file "ATRX2980.03_" from directory "03298", use:

```
COM1> erf, DSK1, 03298/ATRX2980.03_ <CR>
$R: erf, DSK1, 03298/ATRX2980.03_
   RemoveFile, DSK1, "03298/ATRX2980.03_"
COM1>
```

To remove all files from DSK1, use:

```
COM1> erf, DSK1, all <CR>
$R: erf, DSK1, all
  RemoveFile, DSK1, all
COM1>
```

					+ QZSL1CB				
					+ NAVICL5				
					all				

RxControl: Logging > Internal RINEX Logging > RINEX Logging Options

Use this command to configure RINEX file logging on the disk identified with the *Cd* argument.

The argument *FileDuration* specifies whether a new RINEX file should be started every 15 minutes, every hour, 6 hours or every day. When *FileDuration* is set to none, RINEX logging is disabled and all following arguments are ignored.

ObsInterval specifies the interval of the observation records.

SignalTypes sets the list of signals to encode in the RINEX observation files. The more signals are selected, the bigger the RINEX files.

By default, the RINEX files contain the code and carrier phase observables. The *ExtraObsTypes* argument allows to also include the Doppler (obs code Dx), the C/N_0 (obs code Sx), or the channel number (obs code X).

The argument *RinexVersion* selects which RINEX version to use. v304ShortName generates a v3.04 file, but still using the DOS file naming convention of v2.xx.

The argument MixedNav specifies whether the navigation data is stored in separate files for each constellation (MixedNav set to off), or in a single mixed file (MixedNav set to on). This argument is ignored if RINEXVersion is v211. Note that QZSS and BeiDou navigation data are only available in the mixed navigation file.

In the RINEX file names, the 4-character station identifier is the first four letters of the station code as set by the **setMarkerParameters** command. If the station code is empty, the first four letters of the marker name are used instead.

If desired, it is also possible to add a log session ID prefix to all RINEX file names. This is enabled with the **setGlobalFileNamingOptions** command.

RINEX files are put in daily directories, the directory name being of the form yyddd with yy the 2-digit year and ddd the day of year.

If a RINEX file is currently being logged when issuing this command, the new settings will only be applied when the next RINEX file will be started. This occurs at a rate specified by *FileDuration*. To force the new settings to be immediately applied, RINEX logging must be temporarily stopped (*FileDuration* set to none) and then re-enabled. Changing the RINEX settings (e.g. changing the list of signals to be stored in RINEX) results in the past data to be overwritten in the RINEX file.

Example

To create daily RINEX files with the observation file containing only GPS L1CA data at a 30-s interval, use:

```
COM1> srx1, DSK1, hour24, sec30, GPSL1CA <CR>
$R: srx1, DSK1, hour24, sec30, GPSL1CA
  RINEXLogging, DSK1, hour24, sec30, GPSL1CA, none, v304, on
COM1>
```

setUMSDOnConnect getUMSDOnConnect	Mode				
	off on				

RxControl: Logging > Disk(s) > Disk Access over USB

Use this command to enable or disable automatic activation of the USB mass-storage device (UMSD) upon connecting the USB port to a computer.

When the receiver is attached to your computer through an USB cable, the internal disk (DSK1) can be accessed using a standard file browser, where it appears as a removable drive or USB mass-storage device. This requires the disk to be unmounted by the receiver so that it can be accessed by your computer's operating system. Unmounting the disk can be done manually with the **exeManageDisk** command, or can be done automatically by the receiver each time the USB cable is attached to your computer.

When the *Mode* argument is on, each time the USB cable is connected, the receiver stops logging data and unmounts the internal disk. The disk becomes visible in your file browser. When the USB cable is disconnected, the internal disk is automatically remounted and logging resumes.

When *Mode* is off, activation of the USB mass-storage device is not done automatically and requires manually unmounting the internal disk with the **exeManageDisk** command.

Example

COM1> suoc, off<CR>
\$R: suoc, off
 UMSDOnConnect, off
COM1>

3.2.21 FTP Push of Log Files

'	setFTPPushRINEX getFTPPushRINEX	Server (32)	Path (64)	User (12)	Password (24/2) (8)			
				anonymous				

RxControl: Logging > Internal RINEX Logging > RINEX FTP Push Options

Use this command to automatically send the onboard RINEX files to a remote FTP server (FTP Push). The arguments specify the FTP server hostname or IP address, the path to the remote directory where to put the RINEX files, and the login and password to use. Note that the receiver encrypts the password so that it cannot be read back with the command **getFTPPushRINEX**.

The RINEX files are FTPed when they are complete, as prescribed by the *FileDuration* settings in the **setRINEXLogging** command. The current files are also FTPed when the user disables RINEX logging.

The files are put in the remote directory specified in the *Path* argument. Special character sequences can be used to encode the file date in the path: \S_Y is replaced with the 2-digit year, \S_Y with the 4-digit year, \S_M with the month, \S_M with the day of the month, and \S_Y with the day of the year (starting with 001). To put a literal " \S_M " in the path, use \S_M . After expansion, *Path* must not be longer than 80 characters.

If the directory specified in the *Path* argument does not exist on the remote server, it is created.

If the transfer or the directory creation fails, an error is flagged (enter the command lstInternalFile, Error to see the errors and clear the error flag).

Example

```
COM1> sfpr, ftp.mydomain.com, mydata/%Y%m%d, myname, mypwd <CR>
$R: sfpr, ftp.mydomain.com, mydata/%Y%m%d, myname, mypwd
FTPPushRINEX, "ftp.mydomain.com", "mydata/%Y%m%d",
"myname", "7UU5CL7W1C75DWXX2TEXD3W"

COM1>
```

⁽⁸⁾ Only half of the total password length is available to the user (See Section 3.1.4 on page 66)

sfps	setFTPPushSBF	Server (32)	Path (64)	User (12)	Password (24/2)			
gfps	getFTPPushSBF				(9)			
				anonymous				

RxControl: Logging > Internal Logging Settings > SBF Logging and Upload

Use this command to automatically send the onboard SBF files to a remote FTP server (FTP push). The arguments specify the FTP server hostname or IP address, the path to the remote directory where to put the SBF files, and the login and password to use. Note that the receiver encrypts the password so that it cannot be read back with the command **getFTPPushSBF**.

FTP push is only available in IGS file naming mode (see the **setFileNaming** command). Each time an SBF file is ready, it is FTPed to the specified server. For example, in IGS1H file naming mode, files are FTPed every hour. The current log file is also FTPed when the user disables internal logging.

The files are put in the remote directory specified in the *Path* argument. Special character sequences can be used to encode the file date in the path: \S_Y is replaced with the 2-digit year, \S_Y with the 4-digit year, \S_M with the month, \S_M with the day of the month, and \S_Y with the day of the year (starting with 001). To put a literal " \S_M " in the path, use \S_N . After expansion, *Path* must not be longer than 80 characters.

If the directory specified in the *Path* argument does not exist on the remote server, it is created.

If the transfer or the directory creation fails, an error is flagged (enter the command lstInternalFile, Error to see the errors and clear the error flag).

Example

```
COM1> sfps, ftp.mydomain.com, mydata/%Y%m%d, myname, mypwd <CR> $R: sfps, ftp.mydomain.com, mydata/%Y%m%d, myname, mypwd FTPPushSBF, "ftp.mydomain.com", "mydata/%Y%m%d", "myname", "7UU5CL7W1C75DWXX2TEXD3W"
COM1>
```

⁽⁹⁾ Only half of the total password length is available to the user (See Section 3.1.4 on page 66)

efpt gfpt	exeFTPPushTest getFTPPushTest	Server (45)	Path (64)	, ,	Password (40/2)			
				anonymous				

RxControl: Logging > Test FTP Push to Server

Use this command to test write access to a FTP server.

The arguments specify the FTP server's hostname or IP address, the path to the remote directory where write access will be tested, and the login and password to use.

Upon receiving this command, the receiver tries to connect to the specified FTP server and to write a short file in the directory specified with the *Path* argument. The *Path* may contain variable fields as explained in the **setSBFFTP** command. The file is then deleted from the FTP server.

The process can take several minutes depending on the network latency. At the end, a report message is posted in the activity log. This message can be retrieved with the <code>lstInternalFile</code>, <code>RxMessages</code>, and is also available in the <code>RxMessage</code> SBF block.

Example

COM1> efpt, myftp.com, mydata/%Y%m%d, myname, mypwd<CR>
\$R: efpt, myftp.com, mydata/%Y%m%d, myname, mypwd
FTPPushTest, myftp.com, mydata/%Y%m%d, myname, mypwd
COM1>

⁽¹⁰⁾ Only half of the total password length is available to the user (See Section 3.1.4 on page 66)

3.2.22 MSS/L-Band Configuration

llbb	IstLBandBeams					

Use this command to retrieve the list of user-defined and auto-defined L-Band beams.

The list contains user-defined beams (User1, User2,...) defined with the **setLBandBeams** command and service-specific beams which are automatically updated by the L-Band service provider. Only the enabled user-defined beams are shown.

For each beam, the list contains the beam carrier frequency in Hz, the baud rate, the beam name and the region code. For service-specific beams, the satellite longitude in degrees (from -180 to 180, positive east of Greenwich) and the grant status are also provided. The last entry shows the SVID to which the beam is mapped.

This command is very similar to the command **getLBandBeams**, the only difference being that the latter only reports the list of user-defined beams.

Example

```
COM1> 11bb <CR>
$R; 11bb
---->
$-- BLOCK 1 / 1
LBandBeams, User1, 1535165000, baud1200, "User", "E", Enabled, L13
...
COM1>
```

slbb	setLBandBeams	Beam	Frequency	Rate	Name (8)	Region (8)	Usage		
glbb	getLBandBeams	Beam							
		+ User1		baud600	<u>Unknown</u>	<u>Unknown</u>	<u>Disabled</u>		
		+ User2	1559000000 Hz	<u>baud1200</u>			Enabled		
		all		baud2400					
				baud4800					

RxControl: L-band > Generic L-Band Settings > Satellite Beam Configuration

This command can be used to define/inquire the parameters of user-defined L-Band beams. A beam is characterized by its frequency and baud rate (the *Frequency* and *Rate* arguments). Optionally, a beam name and region ID can also be associated to each beam, for information only. A beam can be enabled or disabled, as set by the *Usage* argument. Only enabled beams can be locked to.

Example

COM1> slbb, User1, 1537460000, baud1200, 25East, E, Enabled <CR>
\$R: slbb, User1, 1537460000, baud1200, 25East, E, Enabled
LBandBeams, User1, 1537460000, baud1200, "25East", "E", Enabled
COM1>

slcs	setLBandCustomServiceID	ServiceID (4)	ScramblingVector	NDAUsage			
glcs	getLBandCustomServiceID						
		0000	0000	<u>off</u>			
				on			

RxControl: L-band > Generic L-Band Settings > Satellite Beam Configuration

This command can be used to define the Service ID, scrambling vector and Null-Data-Algorithm (NDA) usage of the L-Band service provider. The *ServiceID* and *ScramblingVector* are 4-digit hexadecimal numbers.

This command should only be used for test and maintenance purposes.

Example

COM1> slcs, A5A5, 0101, on<CR>
\$R: slcs, A5A5, 0101, on
 LBandCustomServiceID, A5A5, 0101, on
COM1>

sInd	setLBandNTRIPDelivery	Cd				
glnd	getLBandNTRIPDelivery					
		<u>none</u>				
		NTR1				
		NTR2				
		NTR3				
		NTR4				

RxControl: L-band > Generic L-Band Settings > NTRIP Delivery

Use this command to enable reception of L-Band corrections over the NTRIP connection identified with the $\it Cd$ argument.

The selected NTRIP connection (NTRi) must be configured in client mode with the **setNtripSettings** command.

Example

COM1> slnd, NTR1<CR>
\$R: slnd, NTR1
 LBandNTRIPDelivery, NTR1
COM1>

				LBAS2 32	LBAS2 32			

RxControl: L-band > Generic L-Band Settings > Satellite Beam Configuration

This command can be used to define/inquire the main operation mode of the L-Band demodulator.

The following modes are available through the *Mode* argument:

Mode	Description
auto	The demodulator will try to lock to a visible beam, preferring beams to which access has been granted. The list of beams and their status can be retrieved by the command <code>lstlBandBeams</code> .
off	The demodulator will be disabled and will not attempt to lock to any beam.
manual	The demodulator will attempt to lock to the beams identified in the <i>Beami</i> arguments and ignore all other beams. Make sure that the beams identified in the <i>Beami</i> arguments are enabled (see command setlBandBeams).

The second argument Service specifies which service the demodulator has to lock to.

Example

COM1> slsm, manual, Inmarsat, User1, User2<CR>
\$R: slsm, manual, Inmarsat, User1, User2
 LBandSelectMode, manual, Inmarsat, User1, User2
COM1>

Chapter 4

SBF Reference

4.1 SBF Outline

SBF is the binary output format of Septentrio receivers. In this format, the data are arranged in binary blocks referred to as SBF blocks.

Each SBF block consists of a sequence of numeric or alphanumeric fields of different types and sizes. The total block size is always a multiple of 4 bytes.

The fields of an SBF block may have one of the following types:

Туре	Description					
u1	Unsigned integer on 1 byte (8 bits)					
u2	Unsigned integer on 2 bytes (16 bits)					
u4	Unsigned integer on 4 bytes (32 bits)					
u8	Unsigned integer on 8 bytes (64 bits)					
i1	Signed integer on 1 byte (8 bits)					
i2	Signed integer on 2 bytes (16 bits)					
i4	Signed integer on 4 bytes (32 bits)					
i8	Signed integer on 8 bytes (64 bits)					
f4	IEEE float on 4 bytes (32 bits)					
f8	IEEE float on 8 bytes (64 bits)					
c1[X]	String of X ASCII characters, right padded with bytes set to 0 if needed.					

Each multi-byte binary type is transmitted as little-endian, meaning that the least significant byte is the first one to be transmitted by the receiver. Signed integers are coded as two's complement.

Every SBF block begins with an 8-byte block header, which is followed by the block body.

4.1.1 SBF Block Header Format

Every SBF block starts with an 8-byte header having the following contents:

Parameter	Туре	Description
Sync		The Sync field is a 2-byte array always set to 0x24, 0x40. The first byte of every SBF block has hexadecimal value 24 (decimal 36, ASCII '\$'). The second byte of every SBF block has hexadecimal value 40 (decimal 64, ASCII '@'). These two bytes identify the beginning of any SBF block and can be used for synchronization.
CRC	u2	The CRC field is the 16-bit CRC of all the bytes in an SBF block from and including the ID field to the last byte of the block. The generator polynomial for this CRC is the so-called CRC-CCITT polynomial: $x^{16} + x^{12} + x^5 + x^0$. The CRC is computed in the forward direction using a seed of 0, no reverse and no final XOR.
ID	u2	The ID field is a 2-byte block ID, which uniquely identifies the block type and its contents. It is a bit field with the following definition: bits 0-12: block number;
		bits 13-15: block revision number, starting from 0 at the initial block definition, and incrementing each time backwards-compatible changes are performed to the block (see section 4.1.6).
Length	u2	The Length field is a 2-byte unsigned integer containing the size of the SBF block. It is the total number of bytes in the SBF block including the header. It is always a multiple of 4.

4.1.2 SBF Block Names and Numbers

The structure and contents of an SBF block are unambiguously identified by the block ID. For easier readability, a block name is also defined for each block. When invoking the **setSBFOutput** command to enable a given block, the block name should be specified.

The list of SBF blocks available on your receiver can be found in Appendix B.

4.1.3 SBF Block Time Stamp (TOW and WNc)

Each SBF header is directly followed by a time stamp, which consists of two fields: ${\tt TOW}$ and ${\tt WNc}$:

Parame	Parameter Type Units & Scale Do-Not-Use			Description
		Factor	Value	
TOW	u4	0.001 s		Time-Of-Week: Time-tag, expressed in whole milliseconds from the beginning of the current GPS week.
WNC	u2	1 week		The GPS week number associated with the TOW. WNC is a continuous week count (hence the "c"). It is not affected by GPS week rollovers, which occur every 1024 weeks. By definition of the Galileo system time, WNC is also the Galileo week number plus 1024.

In the SBF time stamps, the definition of the week always follows the GPS convention even if the block contains data for another constellation. This means that WNc 0, TOW 0 corresponds to Jan 06,1980 at 00:00:00 UTC.

If the time-of-week or the week number is unknown, which is typically the case for a few seconds after start-up, the corresponding field is set to its Do-Not-Use value (see section 4.1.7). It does not mean that the SBF block is unusable, but simply that the receiver could not time-tag it. It is typical that the ${\tt TOW}$ field becomes valid before the WNc field.

The interpretation to give to the time stamp is block-dependent. Three types of time stamps are possible:

- Receiver time stamp: this type of time stamp is used for the SBF blocks containing synchronous data, i.e. data generated at a given epoch in the receiver time scale. Examples of such blocks are the measurement and PVT blocks (MeasEpoch and PVTCartesian). The time stamp is always a multiple of the output interval as specified by the setSBFOutput command (see also section 4.1.8). As soon as the receiver time is aligned with the GNSS time, the receiver time stamp is guaranteed to never decrease in successive SBF blocks.
- *SIS time stamp*: it is used for asynchronous blocks containing navigation message data from the signal-in-space. The time stamp corresponds to the time of transmission of the end of the last navigation bit used to build the SBF block. It always follows the GPS convention, as explained above.
- External time stamp: this type of time stamp is used for SBF blocks triggered by external asynchronous events, such as the ExtEvent block.

For the blocks with a SIS or an external time stamp, there is no strict relation between the time stamp of the SBF blocks and their order of transmission. For example, the SBF stream may contain a <code>GPSNav</code> block with ephemeris parameters received one hour in the past (i.e. the time stamp is one hour in the past) followed by another block with a current receiver time stamp.

4.1.4 Sub-blocks

Some blocks contain sub-blocks. For example, the <code>SatVisibility</code> block contains N <code>SatInfo</code> sub-blocks, each sub-block containing data for one particular satellite. Unless the

size of the sub-blocks is mentioned explicitly in the block description, SBF blocks that contain sub-blocks also contain a SBLength field, which indicates the size of the sub-blocks in bytes.

4.1.5 Padding Bytes

Padding bytes are foreseen at the end of most SBF blocks and sub-blocks, so that their total size is equal to Length or SBLength respectively. The padding bytes are just placeholders and should not be looked at by the decoding software. Their value is not defined.

4.1.6 SBF Revision Number

Each SBF block has an associated revision number. The revision number is incremented each time a backwards-compatible change is implemented.

As described in section 4.1.1, the block number is to be found in bits 0 to 12 of the ID field, and the revision is in bits 13 to 15 of that field.

A backwards-compatible change consists of adding one or more fields in the padding bytes, or in the fields marked as "reserved" in the block description. Such change should be unnoticed by properly written decoding software that ignore the contents of padding and reserved fields (see also section 4.1.12). Each time such change happens, the revision number is incremented. The revision at which a given field has been introduced is documented in the block description in chapter 4.2, unless that revision is 0 (see the <code>ReceiverSetup</code> block as an example). It is guaranteed that if a given field exists in revision N, it will also exist in all revisions after N: no fields are withdrawn from SBF.

4.1.7 Do-Not-Use Value

It might happen that one or more pieces of data in an SBF block are not known at block creation time. For example, when there are insufficient satellite measurements to compute a position solution, the position components found in the X, Y and Z fields of the PVTCartesian block will not be available. To indicate that a given data item is not available or is currently not provided by the receiver, the corresponding field is set to a 'Do-Not-Use' value that is never reached in normal operation.

When applicable, the Do-Not-Use value is mentioned in the block description. The Do-Not-Use value refers to the raw contents of the field, without applying the scale factor. A field set to its Do-Not-Use value should always be discarded by the decoding software.

4.1.8 Output Rate

In general, the default output rate for each SBF block is the renewal rate of the information. For instance, the <code>GPSNav</code> block is output each time a new ephemeris data set is received from a given GPS satellite. The default output rates of GNSS measurement blocks, PVT blocks and integrated INS/GNSS blocks depend on your permission set. These three rates can be checked by the command <code>getReceiverCapabilities</code>.

The default output rate is specified for each block in chapter 4.2. To instruct the receiver to output a given block at its default rate, the "OnChange" rate has to be specified in the setSBFOutput command.

Some blocks can only be output at their default rate (e.g. the GPSNav block). Others can be decimated to a user-selectable rate. A subset of blocks can also be output "once" using the exeSBFOnce command. This can be handy to get a one-shot overview of a particular receiver state. Whether a given block supports a user-selectable rate ("Flex Rate") and whether it belongs to the "output once" set is indicated in the SBF block list in Appendix B.

Attempting to force another rate than the default one for those blocks that do not support "Flex Rate" has no effect: those blocks are always output at their default rate.

Satellite ID and GLONASS Frequency Num-4.1.9 ber

Satellites are identified by the SVID (or PRN) and FreqNr fields, defined as in the table below.

This table is only valid for the currently-supported constellations and signal types (see 4.1.10). To ensure compatibility with future SBF upgrades, decoding software must ignore SBF blocks and sub-blocks of which the satellite ID field or the signal number field is undefined in this document.

Field	Туре	Do-Not-Use		Description	RINEX satellite code
		Value			
SVID or PRN	u1	0	Satellite l	D: The following ranges are defined:	
			1-37:	PRN number of a GPS satellite	Gnn (nn = SVID)
				Slot number of a GLONASS satellite with an offset of 37 (R01 to R24) $$	Rnn (nn = SVID-37)
			62:	GLONASS satellite of which the slot number is not known	NA
				Slot number of a GLONASS satellite with an offset of 38 (R25 to R30)	Rnn (nn = SVID-38)
			71-106:	PRN number of a GALILEO satellite with an offset of 70	<i>Enn</i> (<i>nn</i> = SVID-70)
				L-Band (MSS) satellite. Corresponding satellite name can be found in the LBandBeams block.	NA
			120-140:	PRN number of an SBAS satellite (S120 to S140)	<i>Snn</i> (<i>nn</i> = SVID-100)
			141-180:	PRN number of a BeiDou satellite with an offset of 140	Cnn (nn = SVID-140)
			181-190:	PRN number of a QZSS satellite with an offset of 180	<i>Jnn (nn</i> = SVID-180)
				PRN number of a NavIC/IRNSS satellite with an offset of 190 (I01 to I07)	<i>Inn</i> (<i>nn</i> = SVID-190)
				PRN number of an SBAS satellite with an offset of 57 (S141 to S158)	Snn (nn = SVID-157)
				PRN number of a NavIC/IRNSS satellite with an offset of 208 (108 to 114) $$	Inn (nn = SVID-208)
				PRN number of a BeiDou satellite with an offset of 182 (C41 to C63)	Cnn (nn = SVID-182)
FreqNr	u1		from 1 (d	S frequency number, with an offset of 8. It ranges corresponding to an actual frequency number of -corresponding to an actual frequency number of 6).	
				-GLONASS satellites, <code>FreqNr</code> is reserved and ignored by the decoding software.	

4.1.10 Signal Type

Some sub-blocks contain a signal type field, which identifies the type of signal and modulation the sub-blocks applies to. The signal numbering is defined as follows:

Signal Type	Constellation	Carrier frequency (MHz)	RINEX obs code
I 1CA	GPS	1575 42	1C
1			1W

^(*) See the E6B Used bit in the MeasEpoch SBF block.

4.1.11 Channel Numbering

Some blocks contain a reference to the receiver channel number. Channel numbering starts at one. The maximum value for the channel number depends on the receiver type.

4.1.12 Decoding of SBF Blocks

In order to decode an SBF block, one has to identify the block boundaries in the data stream coming from the receiver. This involves searching for the initial "\$@" characters that mark the beginning of each SBF block. Since the "\$@" sequence can occur in the middle of an SBF block as well, additional checking is needed to make sure that a given "\$@" is indeed the beginning of a block. The following procedure is recommended to decode SBF data stream.

- 1. Wait until the "\$@" character sequence appears in the data stream from the receiver. When it is found, go to point 2.
- 2. Read the next two bytes. It should be the block CRC. Store this value for future reference.
- 3. Read the next two bytes and store them in a buffer. It should be the block ID.
- 4. Read the next two bytes and append them to the buffer. It should be the Length field of the SBF block. It should be a multiple of 4. If not, go back to point 1.
- 5. Read the next (Length-8) bytes and append them to the buffer. Compute the CRC of the buffer. The computed CRC should be equal to the CRC stored at point 2. If not, go back to point 1, else a valid SBF block has been detected and can be interpreted by the reading software.
- 6. If the block number (bits 0 to 12 of the ${\tt ID}$ field decoded at point 3) is of interest to your application, decode the SBF block.
- 7. Go back to point 1 and search for the new occurrence of the "\$@" sequence after the end of the last byte of the block that was just identified.

To ensure compatibility with future upgrades of SBF, it is recommended that the decoding software observes the following rules:

- Only bits 0 to 12 of the ID field must be used to identify a block. Bits 13 to 15 represent the revision number.
- The lengths of SBF blocks and sub-blocks should not be considered constant and hard-coded in the decoding software. Instead, the decoding software must use the Length and SBLength fields encoded in the SBF block.
- · Padding bytes should be ignored.
- Reserved fields and reserved bits in bit-fields should be ignored.
- SBF blocks or sub-blocks of which the satellite ID field or the signal number field is undefined in this document should be ignored (see section 4.1.9).

4.2 SBF Block Definitions

4.2.1 Measurement Blocks

GNSS observables are available in the following SBF blocks:

- the legacy MeasEpoch block, possibly complemented by MeasExtra.
- the Meas3Ranges block, possibly complemented by Meas3Doppler and Meas3CNOHiRes.

The MeasEpoch block contains pseudorange, carrier phase, C/N0 and Doppler observables. The Meas3Ranges block contains pseudoranges, carrier phases and C/N0, while Doppler is available in the companion Meas3Doppler block. The observable resolution is shown in the table below.

	MeasEpoch	Meas3Ranges
Pseudorange	1mm	1mm
Carrier phase	0.001cycles	0.001cycles
C/N0	0.25dB-Hz	1dB-Hz
	0.03125dB-Hz with MeasExtra	0.0625dB-Hz with Meas3CNOHiRes
Doppler	0.0001Hz	No Doppler in Meas3Ranges
		1mm/s with Meas3Doppler

The main advantage of the Meas 3 blocks is their reduced size compared to the MeasEpoch blocks. As an illustration, the following table shows the disk space required to log the different measurement-related blocks over one day at a 1-s interval. In this example, measurements from all GPS L1/L2/L5, GLONASS L1/L2, Galileo E1/E6/E5a/E5b and BeiDou B1/B2/B3 signals have been logged (constellation status as of beginning of 2017).

SBF Block	Disk space (1 day, 1 Hz)
MeasEpoch	104MB
MeasExtra	110MB
Meas3Ranges	28MB
Meas3Doppler	10MB
Meas3CN0HiRes	5MB
Meas3Doppler	10MB

MeasEpoch	Number:	4027				
	"OnChange"	interval: internal	measurement	rate	(receiver-type	depen-
		dent)				

This block contains all the GNSS measurements (observables) taken at the time given by the TOW and WNc fields.

For each tracked signal, the following measurement set is available:

- the pseudorange
- the carrier phase
- · the Doppler
- the C/N0
- the lock-time.

To decrease the block size, all the measurements from a given satellite are referenced to one master measurement set. For instance, the L2 pseudorange (C2) is not much different from the L1 pseudorange (C1), such that the difference between C2 and C1 is encoded, instead of the absolute value of C2.

This is done by using a two-level sub-block structure. All the measurements from a given satellite are stored in a MeasEpochChannelType1 sub-block. The first part of this sub-block contains the master measurements, encoded as absolute values. The second part contains slave measurements, for which only the delta values are encoded in smaller MeasEpochChannelType2 sub-blocks.

Every MeasEpochChannelType1 sub-block contains a field "N2", which gives the number of nested MeasEpochChannelType2 sub-blocks. If there is only one signal tracked for a given satellite, there are no slave measurements and ${\tt N2}$ is set to 0.

Decoding is done as follows:

- 1. Decode the master measurements and the the MeasEpochChannelType1 sub-block.
- 2. If N2 is not 0, decode the N2 nested MeasEpochChannelType2 sub-blocks.
- 3. Go back to 1 till the N1 MeasEpochChannelType1 sub-blocks have been decoded.

Note that measurements in this block are scrambled if the "Measurement Availability" permission is not granted on your receiver. See also bit 7 of the CommonFlags field.

Parameter	Туре	Units	Do-Not-Use	Description
Sync1	c1			
Sync2	c1			
CRC	u2			Block Header, see 4.1.1
ID	u2			
Length	u2	1 byte		
TOW	u4	0.001 s	4294967295	Possiver time stamp see 4.1.2
WNc	u2	1 week	65535	Receiver time stamp, see 4.1.3
N1	u1			Number of MeasEpochChannelType1 sub-blocks in this MeasEpoch block.
SB1Length	u1	1 byte		Length of a MeasEpochChannelType1 sub-block, excluding the nested MeasEpochChannelType2 sub-blocks
SB2Length	u1	1 byte		Length of a MeasEpochChannelType2 sub-block
CommonFlags	u1			Bit field containing flags common to all measurements.
				Bit 0: Multipath mitigation: if this bit is set, multipath mitigation is enabled. (see the setMultipathMitigation command). Bit 1: Smoothing of code: if this bit is set, at least one of the code measurements are smoothed values (see setSmoothingInterval command). Bit 2: Reserved Bit 3: Clock steering: this bit is set if clock steering is active (see setClockSyncThreshold command). Bit 4: Not applicable. Bit 5: High dynamics: this bit is set when the receiver is in high-dynamics mode (either on request of the user using the setReceiverDynamics, high command, or based on the receiver's built-in high-dynamics detection algorithms). Bit 6: E6B used: this bit is set if the Galileo E6 measurements in this block are obtained using the E6B signal instead of the default E6C signal. This happens when E6C encryption is active on at least one of the Galileo satellites. Bit 7: Scrambling: bit set when the measurements are scrambled. Scram-
CumClkJumps	u1	0.001 s		bling is applied when the "Measurement Availability" permission is not granted (see the lif, Permissions command). Cumulative millisecond clock jumps since start-up, with an ambiguity of
				k*256 ms. For example, if two clock jumps of -1 ms have occurred since startup, this field contains the value 254.
Reserved	u1			Reserved for future use, to be ignored by decoding software
Type1				A succession of N1 MeasEpochChannelType1 sub-blocks, see definition below
Padding	u1[]			Padding bytes, see 4.1.5

Rev 1

${\tt MeasEpochChannelType1} \ \ \textbf{sub-block definition:}$

Parameter	Туре	Units	Do-Not-Use	Description
RxChannel	u1			Receiver channel on which this satellite is currently tracked (see 4.1.11).
Type	u1			Bit field indicating the signal type and antenna ID:
				Bits 0-4: SigIdxLo: if not 31, this is the signal number (see 4.1.10), otherwise the signal number can be found in the ObsInfo field below. Bits 5-7: Antenna ID: 0 for main, 1 for Aux1 and 2 for Aux2
SVID	u1			Satellite ID, see 4.1.9
Misc	u1			Bit field containing the MSB of the pseudorange.
		4294967.296 m	0 (1)	Bits 0-3: CodeMSB: MSB of the pseudorange (this is an unsigned value). Bits 4-7: Reserved
CodeLSB	u4	0.001 m	0 (1)	LSB of the pseudorange. The pseudorange expressed in meters is computed as follows: PR _{type1} [m] = (CodeMSB*4294967296+CodeLSB)*0.001 where CodeMSB is part of the Misc field.
D 1	i4	0.0001 Hz	0147400640	<u>'</u>
Doppler	14	0.0001 H2	-2147463646	Carrier Doppler (positive for approaching satellites). To compute the Doppler in Hz, use: $D_{type1}[Hz] = Doppler*0.0001$
CarrierLSB	u2	0.001 cycles	0 (2)	LSB of the carrier phase relative to the pseudorange
CarrierMSB	i1	65.536 cycles	-128 ⁽²⁾	MSB of the carrier phase relative to the pseudorange. The full carrier phase can be computed by: $L[\text{cycles}] = PR_{\text{type1}}[\text{m}]/\lambda \\ + (\text{CarrierMSB*65536+CarrierLSB})*0.001$ where λ is the carrier wavelength corresponding to the frequency of the signal type in the Type field above: λ =299792458/f _L m, with f _L the carrier frequency as listed in
				section 4.1.10.
CN0	u1	0.25 dB-Hz	255	The C/N0 in dB-Hz is computed as follows, depending on the signal type in the $Type$ field: $C/N_0[dB-Hz] = CN0*0.25$ if the signal number is 1 or 2 $C/N_0[dB-Hz] = CN0*0.25+10$ otherwise
				MeasExtra SBF block. The Misc field of that block allows to extend the resolution to 0.03125dB-Hz.
LockTime	u2	1 s	65535	Duration of continuous carrier phase. The lock-time is reset at the initial lock of the phase-locked-loop, and whenever a loss of lock condition occurs.
				If the lock-time is longer than 65534s, it is clipped to 65534s.
				If the carrier phase measurement is not available, this field is set to its Do-Not-Use value.

ObsInfo	u1	Bit field:
		Bit 0: if set, the pseudorange measurement is smoothed
		Bit 1: Reserved.
		Bit 2: Half-Cycle: this bit is set when the carrier phase (L) has a half-cycle ambiguity
		Bits 3-7: The interpretation of these bits depends on the value of ${\tt SigIdxLo}$ from the ${\tt Type}$ field.
		If SigIdxLo equals 31, these bits contain the signal number with an offset of 32 (see 4.1.10). For example, a value of 1 corresponds to signal number 33 (QZSS L1S).
		If SigIdxLo is 8, 9, 10 or 11, these bits contain the GLONASS frequency number with an offset of 8. For example, a value of 1 corresponds to frequency number -7.
		Otherwise, these bits are reserved.
N2	u1	Number of MeasEpochChannelType2 sub-blocks contained in this MeasEpochChannelType1 sub-block.
Padding	u1[]	Padding bytes, see 4.1.5
Туре2		 A succession of N2 MeasEpochChannelType2 sub-blocks, see definition below

MeasEpochChannelType2 sub-block definition:

Parameter	Туре	Units	Do-Not-Use	Description		
Туре	u1			Bit field indicating the signal type and antenna ID:		
				Bits 0-4: SigIdxLo: if not 31, this is the signal number (see 4.1.10), otherwise the signal number can be found in the ObsInfo field below. Bits 5-7: Antenna ID: 0 for main, 1 for Aux1 and 2 for Aux2		
LockTime	u1	1 s	255	See corresponding field in the MeasEpochChannelType1 subblock above, except that the value is clipped to 254 instead of 65534.		
CN0	u1	0.25 dB-Hz	255	See corresponding field in the MeasEpochChannelType1 subblock above.		
OffsetsMSB	u1			Bit field containing the MSB of the code and of the Doppler offsets with respect to the MeasEpochChannelType1 sub-block.		
		65.536 m	-4 ⁽³⁾	Bits 0-2: CodeOffsetMSB: MSB of the code offset.		
		6.5536 Hz	-16 ⁽⁴⁾	Bits 3-7: DopplerOffsetMSB: MSB of the Doppler offset.		
				CodeOffsetMSB and DopplerOffsetMSB are coded as two complement. Refer to the CodeOffsetLSB and DopplerOffsetLSB fields are see how to use this field.		
CarrierMSB	i1	65.536 cycles	-128 ⁽⁵⁾	MSB of the carrier phase relative to the pseudorange.		
ObsInfo	u1			Bit field:		
				Bit 0: if set, the pseudorange measurement is smoothed		
				Bit 1: Reserved.		
				Bit 2: Half-Cycle: this bit is set when the carrier phase (L) has a half-cycle ambiguity		
				Bits 3-7: If SigIdxLo from the Type field of this sub-block equals 31, these bits contain the signal number with an offset of 32 (see 4.1.10), e.g. 1 corresponds to signal number 33 (QZSS L1S). Otherwise they are reserved and must be ignored by the decoding software.		

The pseudorange is invalid if both CodeMSB is 0 and CodeLSB is 0.
The carrier phase is invalid if both CarrierMSB is -128 and CarrierLSB is 0.

CodeOffsetLSB	u2	0.001 m	0 (3)	LSB of the code offset with respect to pseudorange in the MeasEpochChannelType1 sub-block. To compute the pseudorange, use: $PR_{type2} \ [m] = PR_{type1} [m] \\ + (\texttt{CodeOffsetMSB*65536+CodeOffsetLSB})*0.001$
CarrierLSB	u2	0.001 cycles	0 (5)	LSB of the carrier phase relative to the pseudorange. The full carrier phase can be computed by:
DopplerOffsetLSB	u2	0.0001 Hz	0 (4)	LSB of the Doppler offset relative to the Doppler in the MeasEpochChannelType1 sub-block. To compute the Doppler, use: $D_{type2}[\text{Hz}] = D_{type1}[\text{Hz}] * \alpha \\ + (\text{DopplerOffsetMSB*65536+DopplerOffsetLSB}) \\ *1e-4,$ where α is the ratio of the carrier frequency corresponding to the observable type in this MeasEpochChannelType2 sub-block, and that of the master observable type in the parent MeasEpochChannelType1 sub-block (see section 4.1.10 for a list of all carrier frequencies).
Padding	u1[]			Padding bytes, see 4.1.5

The pseudorange is invalid if both CodeOffsetMSB is -4 and CodeOffsetLSB is 0.

The Doppler is invalid if both DopplerOffsetMSB is -16 and DopplerOffsetLSB is 0.

The carrier phase is invalid if both CarrierMSB is -128 and CarrierLSB is 0.

MeasExtra	Number:	4000				
	"OnChange"	interval: internal	measurement	rate	(receiver-type	depen-
		dent)				

This block contains extra information associated with the measurements contained in the MeasEpoch block, such as the internal corrections parameters applied during the measurement pre-processing, and the noise variances.

Parameter	Туре	Units	Do-Not-Use	Description
Sync1	c1			
Sync2	c1			
CRC	u2			Block Header, see 4.1.1
ID	u2			
Length	u2	1 byte		
TOW	u4	0.001 s	4294967295	Receiver time stamp, see 4.1.3
WNc	u2	1 week	65535	Receiver time stamp, see 4.1.5
N	u1			Number of sub-blocks in this MeasExtra block, modulo 256. Use the following formula to compute the number of sub-blocks from the N, Length and SBLength fields:
SBLength	u1	1 byte		Length of a sub-block
DopplerVarFactor	f4	1 Hz ² / cycle ²		Factor to be used to compute the Doppler variance from the carrier phase variance. More specifically, the Doppler variance in mHz^2 can be computed by: $\sigma_{\mathrm{Doppler}}^2[\mathrm{mHz}^2] = \mathrm{CarrierVariance} * \mathrm{DopplerVarFactor},$ where $\mathrm{CarrierVariance}$ can be found for each measurement type in the $\mathrm{MeasExtraChannelSub}$ sub-blocks.
ChannelSub				A succession of NrSB MeasExtraChannelSub sub-blocks, see defi- nition below
Padding	u1[]			Padding bytes, see 4.1.5

MeasExtraChannelSub sub-block definition:

Parameter	Туре	Units	Do-Not-Use	Description
RxChannel	u1			Receiver channel on which this satellite is currently tracked (see 4.1.11).
Type	u1			Bit field indicating the signal type and antenna ID:
				Bits 0-4: SigIdxLo: if not 31, this is the signal number (see 4.1.10), otherwise the signal number can be found in the Misc field below. A value of 31 can only happen on block revision 3 or above. Bits 5-7: Antenna ID: 0 for main, 1 for Aux1 and 2 for Aux2
MPCorrection	i2	0.001 m		Multipath correction applied to the pseudorange. This number has to be added to the pseudorange to recover the raw pseudorange as it would be if multipath mitigation was not used.
SmoothingCorr	i2	0.001 m		Smoothing correction applied to the pseudorange. This number has to be added to the pseudorange to recover the raw pseudorange as it would be if smoothing was disabled.
CodeVar	u2	0.0001 m ²	65535	Estimated code tracking noise variance. If the variance is larger than 65534 $\rm cm^2$, it is clipped to 65534 $\rm cm^2$.
CarrierVar	u2	1 mcycle ²	65535	Estimated carrier tracking noise variance. This value can be multiplied by <code>DopplerVarFactor</code> to compute the Doppler measurement variance. If the variance is larger than 65534 mcycles ² , it is clipped
				to 65534 mcycles ² .
LockTime	u2	1 s	65535	Duration of continuous carrier phase. The lock-time is reset at the initial lock after a signal (re)acquisition.
				If the lock-time is longer than 65534s, it is clipped to 65534s.
				If the carrier phase measurement is not available, this field is set to its Do-Not-Use value.
CumLossCont	u1			Carrier phase cumulative loss-of-continuity counter (modulo 256) for the signal type, antenna and satellite this sub-block refers to. This counter starts at zero at receiver start-up, and is incremented at each initial lock after signal (re)acquisition, or when a cycle slip is detected.
CarMPCorr	i1	1.953125 mcycle		Multipath correction applied to the carrier phase, in units of 1/512 cycles. This number has to be added to the carrier phase to recover the raw phase as it would be if multipath mitigation was not used.
Info	u1			Bit field:
				Bit 0: Reserved.
				Bit 1: Reserved.
101	1			Bits 2-7: Reserved.
Misc	u1	0.03125 dB-Hz		Bit field: Bits 0-2: CN0HighRes: high-resolution extension of the C/N0 (unsigned value from 0 to 7). The C/N0 value in the MeasEpoch SBF block has a resolution of 0.25dB-Hz. CN0HighRes can be used to extend the resolution to 0.03125dB-Hz. The high-resolution C/N0, in dB-Hz, is computed as follows: C/N _{0,HighRes} = C/N _{0,MeasEpoch} +CN0HighRes*0.03125
				where C/N _{0,MeasEpoch} is the C/N0 value coming from the MeasEpoch SBF block. Bits 3-7: If SigIdxLo from the Type field equals 31, these bits contain the signal number with an offset of 32 (see 4.1.10). Otherwise they are reserved.
Padding	u1[]			Padding bytes, see 4.1.5

Rev 3

Meas3Ranges	Number:	4109				
	"OnChange"	interval: internal	measurement	rate	(receiver-type	de-
		pendent)			

This block contains all the code, carrier phase and C/N0 observables at a given measurement epoch. The resolution is 0.001m, 0.001cycles and 1dB-Hz for the code, carrier and C/N0 measurements respectively.

Applications requiring Doppler measurements can log the Meas3Doppler SBF block in addition to the Meas3Ranges block. Applications requiring extended C/N0 resolution (1/16dB-Hz) can log the Meas3CNOHiRes SBF block in addition to the Meas3Ranges block.

The advantage of this block compared to the MeasEpoch SBF block is its reduced size while offering the full resolution for the code and carrier measurements. One of the techniques used to reduce the size is to only encode full measurements (reference epochs) every N epochs. Between these reference epochs, Meas3Ranges contains delta epochs where the difference between the current measurements and the ones at the applicable reference epoch is encoded. The decoder must have received and stored the applicable reference epoch to be able to decode delta epochs. When streaming SBF over an unreliable communication link, if the reference epoch is lost, subsequent Meas3Ranges blocks cannot be decoded until the next reference epoch is received. The interval at which reference epochs are encoded can be controlled with the setMeas3MaxRefInterval command. A longer interval generally reduces the average block size, at the expense of a longer data gap in case a reference epoch is lost.

See also page 262 for additional information.

The format of this block and of the other Meas3 blocks is complex and is not provided here. Details can be obtained from Septentrio Support. The RxTools installation contains the complete source code of a decoder in C language, together with sbf2asc, a small application showing how to use it. All C files can be found under the sbf2asc folder in the RxTools installation. The main measurement decoding function is sbfread_MeasCollectAndDecode() in the sbfread_meas.c file. Users interested in decoding the Meas3 blocks are strongly advised to use the provided source code instead of writing their own decoder.

Meas3CN0HiRes	Number:	4110			
	"OnChange"	interval: internal	measurement	rate	(receiver-type
		depende	ent)		

The Meas3CN0HiRes block is an extension of the Meas3Ranges block containing the fractional part of the C/N0 values. The resolution of the C/N0 value in the Meas3Ranges SBF block is 1dB-Hz. Applications requiring a finer C/N0 resolution (0.0625dB-Hz) must log the Meas3CN0HiRes block together with the Meas3Ranges block.

Meas3Doppler	Number:	4111		
	"OnChange"	interval: internal measurement rate (receiver-type de-		
	pendent)			

The Meas3Doppler block is an extension of the Meas3Ranges block containing the range-rate (Doppler) values. Applications requiring range-rate or Doppler observables must log the Meas3Doppler block together with the Meas3Ranges block.

Meas3PP N	Number:	4112
	"OnChange"	interval: internal measurement rate (receiver-type dependent)

The Meas 3PP block is an extension of the Meas 3Ranges block containing various Septentrio-proprietary flags and values needed for accurate post-processing or re-processing of the PVT from the measurements in the Meas 3Ranges SBF block. This block must be logged together with Meas 3Ranges.

Meas3MP	Number:	4113
	"OnChange"	interval: internal measurement rate (receiver-type dependent)

The Meas3MP block is an extension of the Meas3Ranges block containing the multipath correction applied by the receiver. It can be used for research purposes to undo the receiver multipath mitigation and revert to unmitigated data. This block must be logged together with Meas3Ranges.

EndOfMeas	Number:	5922				
	"OnChange"	interval: internal	measurement	rate	(receiver-type	depen-
		dent)				

This block marks the end of the transmission of all measurement-related blocks belonging to a given epoch.

Parameter	Туре	Units	Do-Not-Use	Description

4.2.2 Navigation Page Blocks

GPSRawCA	Number:	4017	
	"OnChange"	interval: 6s	

This block contains the 300 bits of a GPS C/A subframe. It is generated each time a new subframe is received, i.e. every 6 seconds.

Parameter	Туре	Units	Do-Not-Use	Description
Sync1	c1			
Sync2	c1			
CRC	u2			Block Header, see 4.1.1
ID	u2			
Length	u2	1 byte		
TOW	u4	0.001 s	4294967295	SIS time stamp, see 4.1.3
WNc	u2	1 week	65535	Job time stamp, see 4.1.5
SVID	u1			Satellite ID, see 4.1.9
CRCPassed	u1			Status of the CRC or parity check: 0: CRC or parity check failed 1: CRC or parity check passed
ViterbiCnt	u1			Not applicable
Source	u1			Bit field: Bits 0-4: Signal type from which the bits have been received, as defined in 4.1.10 Bits 5-7: Reserved
FreqNr	u1			Not applicable
RxChannel	u1			Receiver channel (see 4.1.11).
NAVBits	u4[10]			NAVBits contains the 300 bits of a GPS C/A subframe. Encoding: For easier parsing, the bits are stored as a succession of 10 32-bit words. Since the actual words in the subframe are 30-bit long, two unused bits are inserted in each 32-bit word. More specifically, each 32-bit word has the following format: Bits 0-5: 6 parity bits (referred to as D_{25} to D_{30} in the GPS ICD), XOR-ed with the last transmitted bit of the previous word (D_{30}^*)). Bits 6-29: source data bits (referred to as d_n in the GPS ICD). The first received bit is the MSB. Bits 30-31: Reserved
Padding	u1[]			Padding bytes, see 4.1.5

This block contains the 300 bits of a GPS L2C CNAV subframe (the so-called $\mathcal{D}_{c}(t)$ data stream).

Parameter	Type	Units	Do-Not-Use	Description
Sync1	c1			
Sync2	c1

WNc	u2	1 week	65535	313 time stamp, see 4.1.3
SVID	u1			Satellite ID, see 4.1.9
CRCPassed	u1			Status of the CRC or parity check: 0: CRC or parity check failed 1: CRC or parity check passed
ViterbiCnt	u1			Viterbi decoder error count over the page
Source	u1			Bit field: Bits 0-4: Signal type from which the bits have been received, as defined in 4.1.10 Bits 5-6: Reserved Bit 7: Reserved
FreqNr	u1			Not applicable
RxChannel	u1			Receiver channel (see 4.1.11).
NAVBits	u4[8]			NavBits contains the 244 bits of a Galileo F/NAV page. Encoding: NAVBits contains all the bits of the frame, with the exception of the synchronization field. The first received bit is stored as the MSB of NAVBits[0]. The unused bits in NAVBits[7] must be ignored by the decoding software.
Padding	u1[]			Padding bytes, see 4.1.5

GALRawINAV Number: 4023
"OnChange" interval: 2s

This block contains the 234 bits of a Galileo I/NAV navigation page, after deinterleaving and Viterbi decoding.

Parameter	Туре	Units	Do-Not-Use	Description
Sync1	c1			
Sync2	c1			
CRC	u2			Block Header, see 4.1.1
ID	u2			
Length	u2	1 byte		
TOW	u4	0.001 s	4294967295	SIS time stamp, see 4.1.3
WNc	u2	1 week	65535	ois time stamp, see 4.1.5
SVID	u1			Satellite ID, see 4.1.9
CRCPassed	u1			Status of the CRC or parity check: 0: CRC or parity check failed 1: CRC or parity check passed
ViterbiCnt	u1			Viterbi decoder error count over the page
Source	u1			Bit field: Bits 0-4: Signal type from which the bits have been received, as defined in 4.1.10 Bit 5: Set when the nav page is the concatenation of a sub-page received from E5b, and a sub-page received from E1BC. In that case, bits 0-4 are set to E1BC. Bit 6: Reserved Bit 7: Reserved
FreqNr	u1			Not applicable
RxChannel	u1			Receiver channel (see 4.1.11).
NAVBits	u4[8]			NAVBits contains the 234 bits of an I/NAV navigation page (in nominal or alert mode). Note that the I/NAV page is transmitted as two sub-pages (the so-called even and odd pages) of duration 1 second each (120 bits each). In this block, the even and odd pages are concatenated, even page first and odd page last. The 6 tails bits at the end of the even page are removed (hence a total of 234 bits). If the even and odd pages have been received from two different carriers (E5b and L1), bit 5 of the Source field is set. Encoding: NAVBits contains all the bits of the frame, with the exception of the synchronization field. The first received bit is stored as the MSB of NAVBits[0]. The unused bits in NAVBits[7] must be ignored by the decoding software.
Padding	u1[]			Padding bytes, see 4.1.5

GALRawCNAV	Number:	4024	
	"OnChange"	interval: 1s	

This block contains the 492 bits of a Galileo C/NAV navigation page, after deinterleaving and Viterbi decoding.

Parameter	Туре	Units	Do-Not-Use	Description
Sync1	c1			
Sync2	с1			
CRC	u2			Block Header, see 4.1.1

WNc	u2	1 week	65535	ois time stamp, see 4.1.5
SVID	u1			Satellite ID, see 4.1.9
CRCPassed	u1			Status of the CRC or parity check: 0: CRC or parity check failed 1: CRC or parity check passed
ViterbiCnt	u1			Viterbi decoder error count over the navigation frame
Source	u1			Bit field: Bits 0-4: Signal type from which the bits have been received, as defined in 4.1.10 Bits 5-7: Reserved
FreqNr	u1			Not applicable
RxChannel	u1			Receiver channel (see 4.1.11).
NAVBits	u4[8]			NAVBits contains the 250 bits of a SBAS navigation frame. Encoding: NAVBits contains all the bits of the frame, including the preamble. The first received bit is stored as the MSB of NAVBits[0]. The unused bits in NAVBits[7] must be ignored by the decoding software.
Padding	u1[]			Padding bytes, see 4.1.5

BDSRaw Number: 4047

"OnChange" interval: 6 seconds (non GEOs), 0.6 s (GEOs)

This block contains the 300 bits of a BeiDou navigation page, as received from the B1I, B2I or B3I signal.

Parameter	Туре	Units	Do-Not-Use	Description
Sync1	c1			
Sync2	c1			
CRC	u2			Block Header, see 4.1.1
ID	u2			
Length	u2	1 byte		
TOW	u4	0.001 s	4294967295	SIS time stamp, see 4.1.3
WNc	u2	1 week	65535	313 time stamp, see 4.1.3
SVID	u1			Satellite ID, see 4.1.9
CRCPassed	u1			Status of the CRC or parity check: 0: CRC or parity check failed 1: CRC or parity check passed
ViterbiCnt	u1			Not applicable
Source	u1			Signal type from which the bits have been received, as defined in 4.1.10
Reserved	u1			Reserved for future use, to be ignored by decoding software.
RxChannel	u1			Receiver channel (see 4.1.11).
NAVBits	u4[10]			NAVBits contains the 300 deinterleaved bits of a BeiDou navigation subframe. Encoding: NAVBits contains all the bits of the subframe, includ-
				ing the preamble and the parity bits. The first received bit is stored as the MSB of $\mathtt{NAVBits[0]}$. The 20 unused bits in $\mathtt{NAVBits[9]}$ must be ignored by the decoding software. The bits are deinterleaved.
Padding	u1[]			Padding bytes, see 4.1.5

BDSRawB1C	Number:	4218	
	"OnChange"	interval: 18s	

This block contains the 1800 symbols of a BeiDou B-CNAV1 navigation frame (itself containing three subframes), as received from the B1C signal.

The symbols are deinterleaved. The receiver attempts to correct bit errors using the LDPC parity bits, but unrecoverable errors are still possible at low C/N0. It is therefore always needed to check the CRC status before using the navigation bits. A separate CRC check is provided for subframe 2 and 3. The receiver does not output navigation frames of which the BCH codes in subframe 1 are invalid, so the validity of subframe 1 does not need to be checked.

Parameter	Туре	Units	Do-Not-Use	Description
Sync1	c1			
Sync2	c1			
CRC	u2			Block Header, see 4.1.1
ID	u2			
Length	u2	1 byte

SVID	u1			Satellite ID, see 4.1.9
CRCSF2	u1			Status of the CRC check of subframe 2: 0: failed 1: passed
CRCSF3	u1			Status of the CRC check of subframe 3: 0: failed 1: passed
Source	u1			Signal type from which the bits have been received, as defined in 4.1.10
Reserved	u1			Reserved for future use, to be ignored by decoding software.
RxChannel	u1			Receiver channel (see 4.1.11).
NAVBits	u4[57]			NAVBits contains the 1800 deinterleaved symbols of a BeiDou B1C (B-CNAV1) navigation frame. Encoding: NAVBits contains all the symbols of the frame. The first received symbol (i.e. the first symbol of subframe 1) is stored as the MSB of NAVBits[0]. The 24 unused bits in NAVBits[56] must be ignored by the decoding software.
Padding	u1[]			Padding bytes, see 4.1.5

BDSRawB2a	Number:	4219	
	"OnChange"	interval: 3s	

This block contains the 576 symbols of a BeiDou B-CNAV2 navigation frame, as received from the B2a signal.

The receiver attempts to correct bit errors using the LDPC parity bits, but unrecoverable errors are still possible at low C/N0. It is therefore always needed to check the CRC status before using the navigation bits.

Parameter	Туре	Units	Do-Not-Use	Description
Sync1	c1			
Sync2	c1			
CRC	u2			Block Header, see 4.1.1
ID	u2

ViterbiCnt	u1			Not applicable
Source	u1			Signal type from which the bits have been received, as defined in 4.1.10
Reserved	u1			Reserved for future use, to be ignored by decoding software.
RxChannel	u1			Receiver channel (see 4.1.11).
NAVBits	u4[18]			NAVBits contains the 576 symbols of a BeiDou B2a (B-CNAV2) navigation frame.
				Encoding: NAVBits contains all the symbols of the frame, excluding the preamble. The first received symbol (i.e. the MSB of the PRN field) is stored as the MSB of NAVBits $[0]$.
Padding	u1[]			Padding bytes, see 4.1.5

BDSRawB2b	Number:	4242	
	"OnChange"	interval: 1s	

This block contains the raw symbols of a BeiDou B-CNAV3 or PPP-B2b_I navigation frame, as received from the B2b signal.

The receiver attempts to correct bit errors using the LDPC parity bits, but unrecoverable errors are still possible at low C/N0. It is therefore always needed to check the CRC status before using the navigation bits.

TOW	u4	0.001 s	4294967295	SIS time stamp, see 4.1.3
WNc	u2	1 week	65535	- 1
PRNidx	u1			PRN number of the satellite in the GPS constellation (1 for G01, 2 for G02, etc).
Flags	u1			Bit field: Bit 0: Alert: Set to 1 if at least one of the message types of which the contents is included in this block had its alert bit (bit 38) set to 1. Set to 0 otherwise. Bit 1: Integrity Status Flag (bit 272 of MT10). Bit 2: L2C Phasing (bit 273 of MT10). Bits 3-5: Reserved
				Bit 6: L2C used: bit set if at least part of the navigation data has been decoded from L2C. Bit 7: L5 used: bit set if at least part of the navigation data
WN	u2	1 week		has been decoded from L5. Week number (<i>WN</i> , 13 bits from MT10)
Health	u1			L1, L2 and L5 signal health (3 bits from MT10). LSB is L5 health.
URA_ED	i1			Elevation-Dependant accuracy index (<i>URA_{ED}</i> , 5 bits from MT10)
t_op	u4	1 s		Data predict time of week (300 $*t_{op}$, 11 bits from MT10/30)
t_oe	u4	1 s		Ephemeris data reference time of week (300 $*$ t_{oe} , 11 bits from MT10/11)
A	f8	1 m		Semi-major axis at reference time (ΔA , 26 bits from MT10, plus $A_{\rm ref}$)
A_DOT	f8	1 m / s		Change rate in semi-major axis (Å, 25 bits from MT10)
DELTA_N	f4	1 semi-circle / s		Mean motion difference from computed value at reference time (Δn_0 , 17 bits from MT10)
DELTA_N_DOT	f4	1 semi-circle / s ²		Rate of mean motion difference from computed value ($\dot{\Omega n}_0$, 23 bits from MT10)
M_0	f8	1 semi-circle		Mean anomaly at reference time (M_{0-n} , 33 bits from MT10)
е	f8			Eccentricity (<i>e_n</i> , 33 bits from MT10)
omega	f8	1 semi-circle		Argument of perigee (ω_n , 33 bits from MT10)
OMEGA_0	f8	1 semi-circle		Reference right ascension angle (Ω_{0-n} , 33 bits from MT11)
OMEGADOT	f8	1 semi-circle / s		Rate of right ascension ($\Delta\dot{\Omega}$, 17 bits from MT11, plus $\dot{\Omega}_{ref}$)
i_0	f8	1 semi-circle		Inclination angle at reference time (i_{0-n} , 33 bits from MT11)
IDOT	f4	1 semi-circle / s		Rate of inclination angle $(i_{0-n}, 15 \text{ bits from MT11})$
C_is	f4	1 rad		Amplitude of the sine harmonic correction term to the angle of inclination (C_{is-n} , 16 bits from MT11)
C_ic	f4	1 rad		Amplitude of the cosine harmonic correction term to the angle of inclination (C_{ic-n} , 16 bits from MT11)
C_rs	f4	1 m		Amplitude of the sine harmonic correction term to the orbit radius (C_{rs-n} , 24 bits from MT11)
C_rc	f4	1 m		Amplitude of the cosine harmonic correction term to the orbit radius (C_{rc-n} , 24 bits from MT11)
C_us	f4	1 rad		Amplitude of the sine harmonic correction term to the argument of latitude (C_{US-n} , 21 bits from MT11)
C_uc	f4	1 rad		Amplitude of the cosine harmonic correction term to the argument of latitude (C_{uc-n} , 21 bits from MT11)
t_oc	u4	1 s		Clock data reference time (300 $*$ t_{oc} , 11 bits from MT30)

URA_NED0	i1			Non-Elevation-Dependant accuracy index (<i>URA_{NED0}</i> , 5 bits from MT30)
URA_NED1	u1			Non-Elevation-Dependant accuracy change index (URA_{NED1} , 3 bits from MT30)
URA_NED2	u1			Non-Elevation-Dependant accuracy change rate index (<i>URA_{NED2}</i> , 3 bits from MT30)
WN_op	u1	1 week		Week number associated with t_op, modulo 256 (WN_{op} , 8 bits from MT30)
a_f2	f4	1 s / s ²		Clock drift rate correction coefficient (a_{f2-n} , 10 bits from MT30)
a_f1	f4	1 s / s		Clock drift correction coefficient (a_{f1-n} , 20 bits from MT30)
a_f0	f8	1 s		Clock bias correction coefficient (a_{f0-n} , 26 bits from MT30)
T_gd	f4	1 s	$-2 \cdot 10^{10}$	Group delay differential (T_{GD} , 13 bits from MT30)
ISC_L1CA	f4	1 s	-2·10 ¹⁰	Inter-Signal Correction for L1C/A ($ISC_{L1C/A}$, 13 bits from MT30)
ISC_L2C	f4	1 s	$-2 \cdot 10^{10}$	Inter-Signal Correction for L2C (<i>ISC_{L2C}</i> , 13 bits from MT30)
ISC_L5I5	f4	1 s	$-2 \cdot 10^{10}$	Inter-Signal Correction for L5I (<i>ISC</i> _{L5/5} , 13 bits from MT30)
ISC_L5Q5	f4	1 s	$-2 \cdot 10^{10}$	Inter-Signal Correction for L5Q (<i>ISC</i> _{L5Q5} , 13 bits from MT30)
Padding	u1[]			Padding bytes, see 4.1.5

4.2.4 GLONASS Decoded Message Blocks

GLONav	Number:	4004
	"OnChange"	interval: block generated each time a new navigation data set is
		received from a GLONASS satellite

The GLONav block contains the decoded ephemeris data for one GLONASS satellite.

Parameter	Туре	Units	Do-Not-Use	Description
Sync1	c1			
Sync2	c1			
CRC	u2			Block Header, see 4.1.1
ID	u2			
Length	u2	1 byte		
TOW	u4	0.001 s	4294967295	SIS time stamp, see 4.1.3
WNc	u2	1 week	65535	orbitality, see 4.1.5
SVID	u1			ID of the GLONASS satellite for which ephemeris is provided in this block (see 4.1.9).
FreqNr	u1			Frequency number of the GLONASS satellite for which ephemeris is provided in this block (see 4.1.9).
Х	f8	1000 m		x-component of satellite position in PZ-90
Y	f8	1000 m		y-component of satellite position in PZ-90
Z	f8	1000 m		z-component of satellite position in PZ-90
Dx	f4	1000 m / s		x-component of satellite velocity in PZ-90
Dy	f4	1000 m / s		y-component of satellite velocity in PZ-90
Dz	f4	1000 m / s		z-component of satellite velocity in PZ-90
Ddx	f4	1000 m / s ²		x-component of satellite acceleration in PZ-90
Ddy	f4	1000 m / s ²		y-component of satellite acceleration in PZ-90
Ddz	f4	1000 m / s ²		z-component of satellite acceleration in PZ-90
gamma	f4	1 Hz / Hz		$\gamma_{n}(t_{b})$:relative deviation of predicted carrier frequency
tau	f4	1 s		$ au_{\mathrm{n}}(t_{\mathrm{b}})$: time correction to GLONASS time
dtau	f4	1 s		$\Delta au_{ m n}$: time difference between L2 and L1 sub-band
t_oe	u4	1 s		reference time-of-week in GPS time frame
WN_toe	u2	1 week		reference week number in GPS time frame (modulo 1024)
P1	u1	1 minute		time interval between adjacent values of $t_{ m b}$
P2	u1			1-bit odd/even flag of t _b
E	u1	1 day		age of data
В	u1			3-bit health flag, satellite unhealthy if MSB set
tb	u2	1 minute		time of day (center of validity interval)
М	u1			2-bit GLONASS-M satellite identifier (01, otherwise 00)
Р	u1			2-bit mode of computation of time parameters
1	u1			1-bit health flag, 0=healthy, 1=unhealthy
P4	u1			1-bit 'updated' flag of ephemeris data
N_T	u2	1 day		current day number within 4-year interval
F_T	u2	0.01 m		predicted user range accuracy at time t _b
С	u1		255	1-bit health Cn flag from the almanac. This field is set to the last 'Cn' flag received from the almanac. If no 'Cn' flag has been received yet, it is set to its do-not-use value.
Padding	u1[]			Padding bytes, see 4.1.5

Rev 1

GLOAlm	Number:	4005
	"OnChange"	interval: block generated each time a new almanac data set is re-
		ceived from a GLONASS satellite

The ${\tt GLOAlm}$ block contains the decoded navigation data for one GLONASS satellite.

Parameter	Туре	Units	Do-Not-Use	Description
Sync1	c1			
Sync2	c1			
CRC	u2			Block Header, see 4.1.1
ID	u2			
Length	u2	1 byte		
TOW	u4	0.001 s	4294967295	SIS time stamp, see 4.1.3
WNc	u2	1 week	65535	or time stamp, see 1115
SVID	u1			ID of the GLONASS satellite for which almanac is provided in this block (see 4.1.9).
FreqNr	u1			Frequency number of the GLONASS satellite for which almanac is provided in this block (see 4.1.9). This number corresponds to the H^A_n parameter in the GLONASS ICD.
epsilon	f4			$\epsilon_{ m n}^{ m A}$: orbit eccentricity
t_oa	u4	1 s		Reference time-of-week in GPS time frame
Delta_i	f4	1 semi-circle		Δ i $_{\mathrm{n}}^{\mathrm{A}}$: correction to inclination
lambda	f4	1 semi-circle		λ_n^A : Longitude of first ascending node
t_ln	f4	1 s		$t^{\mathrm{A}}_{\lambda\;\mathrm{n}}$: time of first ascending node passage
omega	f4	1 semi-circle		$\omega_{ m n}^{ m A}$: argument of perigee
Delta_T	f4	1 s / orbit-period		Δ T $_{\mathrm{n}}^{\mathrm{A}}$: correction to mean Draconian period
dDelta_T	f4	1 s / orbit-period ²		$d\DeltaT_{\mathrm{n}}^{\mathrm{A}};$ rate of change correction to mean Draconian period
tau	f4	1 s		$ au_n^A$: coarse correction to satellite time
WN_a	u1	1 week		Reference week in GPS time frame (modulo 256)
С	u1			$C_{\mathrm{n}}{}^{\mathrm{A}}$: 1-bit general health flag (1 indicates healthy)
N	u2	1 day		N ^A : calendar day number within 4 year period
М	u1			M_n^A : 2-bit GLONASS-M satellite identifier
N_4	u1			N ₄ : 4 year interval number, starting from 1996
Padding	u1[]			Padding bytes, see 4.1.5

GLOTime	Number:	4036	
	"OnChange"	interval: block generated at the end of each GLONASS su	per-
		frame, i.e. every 2.5 minutes.	

The ${\tt GLOTime}$ block contains the decoded non-immediate data related to the difference between GLONASS and GPS, UTC and UT1 time scales.

Parameter	Туре	Units	Do-Not-Use	Description
Sync1	c1			
Sync2	c1			
CRC	u2			Block Header, see 4.1.1
ID	u2			
Length	u2	1 byte		
TOW	u4	0.001 s	4294967295	SIS time stamp, see 4.1.3
WNc	u2	1 week	65535	313 time stamp, see 4.1.3
SVID	u1			ID of the GLONASS satellite from which the data in this block has been decoded (see 4.1.9).
FreqNr	u1			Frequency number of the GLONASS satellite from which the data in this block has been decoded (see 4.1.9).
N_4	u1			4 year interval number, starting from 1996
KP	u1			notification of leap second
N	u2	1 day		calendar day number within 4 year period
tau_GPS	f4	1 · 10 ⁹ ns		difference with respect to GPS time
tau_c	f8	1 · 10 ⁹ ns		GLONASS time scale correction to UTC(SU)
B1	f4	1 s		difference between UT1 and UTC(SU)
B2	f4	1 s / msd		daily change of B1
Padding	u1[]			Padding bytes, see 4.1.5

4.2.5 Galileo Decoded Message Blocks

GALNav	Number:	4002
	"OnChange"	interval: output each time a new navigation data batch is decoded.

The GalNav block contains the following decoded navigation data for one Galileo satellite:

- orbital elements and clock corrections
- health, Signal-In-Space Accuracy (SISA) indexes and Broadcast Group Delays (BGDs) for each carrier or carrier combinations.

The interpretation of the clock correction parameters (t_oc , a_f0 , a_f1 , a_f2) depends on the value of the Source field:

Source	Message type	Applicable Clock Model
2	I/NAV	(L1,E5b)
16	F/NAV	(L1,E5a)

If the receiver is decoding both the I/NAV and the F/NAV data stream, it will output a <code>GalNav</code> block for the I/NAV stream, containing the (L1, E5b) clock model, and a different <code>GalNav</code> block for the F/NAV stream, containing the (L1, E5a) clock model.

Depending on the message type being decoded, some health, SISA or BGD values may not be available (in that case they are set to their respective Do-Not-Use values). The following health, SISA and BGD values are guaranteed to be available for a given value of the Source field:

Source	Health, SISA and BGD availability
2 (I/NAV)	At least L1-B $_{ m DVS}$, L1-B $_{ m HS}$, E5b $_{ m DVS}$,E5b $_{ m HS}$, SISA_L1E5b and BGD_L1E5b are available
16 (F/NAV)	At least E5a $_{ m DVS}$,E5a $_{ m HS}$, SISA_L1E5a and BGD_L1E5a are available

The <code>IODNav</code> field identifies the issue of data. All orbital elements, clock parameters and SISA values in the block are guaranteed to refer to the same data batch identified by <code>IODNav</code>. The fields <code>Health_OSSOL</code>, <code>BGD_L1E5a</code>, <code>BGD_L1E5b</code> and <code>CNAVenc</code> are not covered by the issue of data, and the block simply contains the latest received value.

Please refer to the Galileo Signal-In-Space ICD for the interpretation and usage of the parameters contained in this SBF block.

Parameter	Туре	Units	Do-Not-Use	Description	
Sync1	c1				
Sync2	c1				
CRC	u2			Block Header, see 4.1.1	
ID	u2

TOW	u4	0.001 s	4294967295	SIS time stamp, see 4.1.3	
WNc	u2	1 week	65535	-SIS time stamp, see 4.1.3	
SVID	u1			SVID of the Galileo satellite (see 4.1.9)	
Source	u1			See table above: this field indicates how to interpret the clock correction parameters.	

		T	ı	T
SQRT_A	f8	1 m ^{1/2}		Square root of the semi-major axis
M_0	f8	1 semi-circle		Mean anomaly at reference time
е	f8			Eccentricity
i_0	f8	1 semi-circle		Inclination angle at reference time
omega	f8	1 semi-circle		Argument of perigee
OMEGA_0	f8	1 semi-circle		Longitude of ascending node of orbit plane at weekly epoch
OMEGADOT	f4	1 semi-circle / s		Rate of right ascension
IDOT	f4	1 semi-circle / s		Rate of inclination angle
DEL_N	f4	1 semi-circle / s		Mean motion difference from computed value
C_uc	f4	1 rad		Amplitude of the cosine harmonic correction term to the argument of latitude
C_us	f4	1 rad		Amplitude of the sine harmonic correction term to the argument of latitude
C_rc	f4	1 m		Amplitude of the cosine harmonic correction term to the orbit radius
C_rs	f4	1 m		Amplitude of the sine harmonic correction term to the orbit radius
C_ic	f4	1 rad		Amplitude of the sine harmonic correction term to the angle of inclination
C_is	f4	1 rad		Amplitude of the cosine harmonic correction term to the angle of inclination
t_oe	u4	1 s		Reference time, ephemeris
t_oc	u4	1 s		Reference time, clock. The ${\tt Source}$ field indicates which clock model ${\tt t_oc}$ refers to.
a_f2	f4	1 s / s ²		SV clock aging. The Source field indicates which clock model a_f2 refers to.
a_f1	f4	1 s / s		SV clock drift. The Source field indicates which clock model a_f1 refers to.
a_f0	f8	1 s		SV clock bias. The Source field indicates which clock model a_f0 refers to.
WNt_oe	u2	1 week		WN associated with t_oe, in GPS time frame, modulo 4096
WNt_oc	u2	1 week		WN associated with t_oc, in GPS time frame, modulo 4096
IODnav	u2			Issue of data, navigation (10 bits)
Health_OSSOL	u2			Bit field indicating the last received Health Status (HS) and Data Validity Status (DVS) of the E5a, E5b and L1-B signals:
				Bit 0: If set, bits 1 to 3 are valid, otherwise they must be ignored. Bit 1: 1-bit L1-B _{DVS}
				$ \begin{array}{ll} \mbox{Bit S 2-3:} & \mbox{2-bit L1-B}_{\rm HS} \\ \mbox{Bit 4:} & \mbox{If set, bits 5 to 7 are valid, otherwise they must be ignored.} \\ \mbox{Bit 5:} & \mbox{1-bit E5b}_{\rm DVS} \\ \mbox{Bits 6-7:} & \mbox{2-bit E5b}_{\rm HS} \\ \end{array} $
				Bit 8: If set, bits 9 to 11 are valid, otherwise they must be ignored. Bit 9: 1-bit $E5a_{\rm DVS}$ Bits 10-11: 2-bit $E5a_{\rm HS}$
				Bits 12-15: Reserved
Health_PRS	u1			Reserved
SISA_L1E5a	u1		255	Signal-In-Space Accuracy Index (L1, E5a)
SISA_L1E5b	u1		255	Signal-In-Space Accuracy Index (L1, E5b)
SISA_L1AE6A	u1		255	Reserved
BGD_L1E5a	f4	1 s	-2·10 ¹⁰	Last received broadcast group delay (L1, E5a)
BGD_L1E5b	f4	1 s	-2·10 ¹⁰	Last received broadcast group delay (L1, E5b)
BGD_L1AE6A	f4	1 s	-2·10 ¹⁰	Reserved
		I .	l	1

CNAVenc	u1	255	2-bit C/NAV encryption status:
			Bit 0: Bit set if E6B is unencrypted
			Bit 1: Bit set if E6C is unencrypted
			Bits 2-7: Reserved
Padding	u1[]		Padding bytes, see 4.1.5

GALAlm	Number:	4003				
	"OnChange"	interval: output each tir	ne a new	almanac set is rece	eived fo	r a
		satellite.				

The GalAlm block contains the decoded almanac data for one Galileo satellite.

Parameter	Туре	Units	Do-Not-Use	Description
Sync1	c1

CRC	u2			Block Header, see 4.1.1
ID	u2			
Length	u2	1 byte		
TOW	u4	0.001 s	4294967295	SIS time stamp, see 4.1.3
WNc	u2	1 week	65535	313 time stamp, see 4.1.3
SVID	u1			SVID of the Galileo satellite from which these almanac parameters have been received (see 4.1.9)
Source	u1			See corresponding field in the GalNav block. Source can take the value 18 to indicate that the almanac data contained in this block has been merged from INAV and FNAV pages.
е	f4			Eccentricity
t_oa	u4	1 s		almanac reference time of week
delta_i	f4	1 semi-circle		Inclination angle at reference time, relative to nominal
OMEGADOT	f4	1 semi-circle / s		Rate of right ascension
SQRT_A	f4	1 m ^{1/2}		Square root of the semi-major axis, relative to nominal
OMEGA_0	f4	1 semi-circle		Longitude of ascending node of orbit plane at weekly epoch
omega	f4	1 semi-circle		Argument of perigee
M_0	f4	1 semi-circle		Mean anomaly at reference time
a_f1	f4	1 s / s		SV clock drift
a_f0	f4	1 s		SV clock bias
WN_a	u1	1 week		2-bit almanac reference week
SVID_A	u1			SVID of the Galileo satellite of which the almanac parameters are provided in this block (see 4.1.9 for the SVID numbering convention).
health	u2			Bit field indicating the health status (HS) of the E5a, E5b and L1-B signals: Bit 0: If set, bits 1 and 2 are valid, otherwise they must be ignored. Bits 1-2: 2-bit L1-B _{HS} Bit 3: If set, bits 4 and 5 are valid, otherwise they must be ignored. Bits 4-5: 2-bit E5b _{HS} Bit 6: If set, bits 7 and 8 are valid, otherwise they must be ignored. Bits 7-8: 2-bit E5a _{HS} Bit 9: Not applicable Bits 10-11: Not applicable Bits 13-14: Not applicable Bits 13-14: Not applicable Bits 15: Reserved
IODa	u1			4-bit Issue of Data for the almanac.
Padding	u1[]			Padding bytes, see 4.1.5

GALIon	Number:	4030		
	"OnChange"	interval: output each time the ionospheric parameters a	are	re-
		ceived from a Galileo satellite.		

The Gallon block contains the decoded ionosphere model parameters of the Galileo system.

Parameter	Туре	Units	Do-Not-Use	Description
Sync1	c1			
Sync2	c1			
CRC	u2			Block Header, see 4.1.1
ID	u2			
Length	u2	1 byte

WNc	u2	1 week	65535	one stamp, see 4.1.5
SVID	u1			SVID of the Galileo satellite from which these parameters have been received (see 4.1.9)
Source	u1			Message type from which the data has been decoded: 2: I/NAV 16: F/NAV
a_i0	f4	1 · 10 ⁻²² W / (m ² Hz)		Effective ionization level, a_{i0}
a_i1	f4	1 · 10 ⁻²² W / (m ² Hz) / deg		Effective ionization level, a _{i1}
a_i2	f4	1 · 10 ⁻²² W / (m ² Hz) / deg ²		Effective ionization level, a_{i2}
StormFlags	u1			Bit field containing the five ionospheric storm flags:
				Bit 0: SF5
				Bit 1: SF4
				Bit 2: SF3
				Bit 3: SF2
				Bit 4: SF1
				Bits 5-7: Reserved
Padding	u1[]			Padding bytes, see 4.1.5

GALUtc	Number:	4031
	"OnChange"	interval: output each time the UTC offset parameters are received
		from a Galileo satellite.

The ${\tt GalUtc}$ block contains the decoded UTC parameter information.

Parameter	Туре	Units	Do-Not-Use	Description
Sync1	c1			
Sync2	c1			
CRC	u2			Block Header, see 4.1.1
ID	u2			
Length	u2	1 byte		
TOW	u4	0.001 s	4294967295	SIS time stamp, see 4.1.3
WNc	u2	1 week	65535	ois time stamp, see 4.1.5
SVID	u1			SVID of the Galileo satellite from which these parameters have been received (see 4.1.9)
Source	u1			Message type from which the data has been decoded: 2: I/NAV 16: F/NAV
A_1	f4	1 s / s	$-2 \cdot 10^{10}$	first order term of polynomial
A_0	f8	1 s	$-2 \cdot 10^{10}$	constant term of polynomial
t_ot	u4	1 s		reference time of week for UTC data
WN_ot	u1	1 week		UTC reference week number, to which t_ot is referenced
DEL_t_LS	i1	1 s		Delta time due to leap seconds whenever the effectivity time is not in the past
WN_LSF	u1	1 week		Effectivity time of leap second (week)
DN	u1	1 day		Effectivity time of leap second (day, from 1 to 7)
DEL_t_LSF	i1	1 s		Delta time due to leap seconds whenever the effectivity time is in the past
Padding	u1[]			Padding bytes, see 4.1.5

GALGstGps	Number:	4032
	"OnChange"	interval: output each time valid GST-GPS offset parameters
		are received from a Galileo satellite.

This block contains the decoded GPS to Galileo System Time offset parameters. This block is only output if these parameters are valid in the navigation page (i.e. if they are not set to "all ones").

Parameter	Туре	Units	Do-Not-Use	Description
Sync1	c1			
Sync2	c1

TOW	u4	0.001 s	4294967295	SIS time stamp, see 4.1.3
WNc	u2	1 week	65535	Job time stamp, see 4.1.5
SVID	u1			SVID of the Galileo satellite from which this RLM has been received.
Source	u1			Message type from which the data has been decoded: 2: I/NAV 16: F/NAV
RLMLength	u1			Length of the RLM message in bits. RLMLength can be either 80 for a short message or 160 for a long message.
Reserved	u1[3]			Reserved for future use, to be ignored by decoding software
RLMBits	u4[N]			Bits in the RLM message, with the first bit being the MSB of RLMBits[0]. N is 3 for a short message (i.e. if RLMLength is 80), and 5 for a long message (i.e. if RLMLength is 160). The 16 unused bits of a short message are set to 0. These bits correspond to the 16 LSBs of RLMBits[2].
Padding	u1[]			Padding bytes, see 4.1.5

4.2.6 BeiDou Decoded Message Blocks

BDSNav	Number:	4081
	"OnChange"	interval: block generated each time a new navigation data set is
		received from a BeiDou satellite

The ${\tt BDSNav}$ block contains the decoded navigation data for one BeiDou satellite, as received from the D1 or D2 nav message.

Parameter	Туре	Units	Do-Not-Use	Description
Sync1	c1			-
Sync2	c1			
CRC	u2			Block Header, see 4.1.1
ID	u2			
Length	u2	1 byte		
TOW	u4	0.001 s	4294967295	SIS time stamp, see 4.1.3
WNc	u2	1 week	65535	-313 time stamp, see 4.1.3
PRN	u1			ID of the BeiDou satellite of which the ephemeris is given in this block (see 4.1.9)
Reserved	u1			Reserved for future use, to be ignored by decoding software
MN	u2	1 week		BeiDou week number as received from the navigation message (from 0 to 8191)
URA	u1			User range accuracy index (4-bit value)
SatH1	u1			1-bit autonomous health
IODC	u1			Age of data, clock (5 bits)
IODE	u1			Age of data, ephemeris (5 bits)
Reserved2	u2			unused, to be ignored by decoding software
T_GD1	f4	1 s		B1l equipment group delay differential
T_GD2	f4	1 s	−2·10 ¹⁰	B2I equipment group delay differential (set to the Do-Not-Use value when unknown)
t_oc	u4	1 s		clock data reference time, in BeiDou system time (lagging GPS time by 14 seconds).
a_f2	f4	1 s / s ²		SV clock aging
a_f1	f4	1 s / s		SV clock drift
a_f0	f4	1 s		SV clock bias
C_rs	f4	1 m		Amplitude of the sine harmonic correction term to the orbit radius
DEL_N	f4	1 semi-circle / s		Mean motion difference from computed value
M_0	f8	1 semi-circle		Mean anomaly at reference time
C_uc	f4	1 rad		Amplitude of the cosine harmonic correction term to the argument of latitude
е	f8			Eccentricity
C_us	f4	1 rad		Amplitude of the sine harmonic correction term to the argument of latitude
SQRT_A	f8	1 m ^{1/2}		Square root of the semi-major axis
t_oe	u4	1 s		Reference time ephemeris, in BeiDou system time (lagging GPS time by 14 seconds).
C_ic	f4	1 rad		Amplitude of the cosine harmonic correction term to the angle of inclination
OMEGA_0	f8	1 semi-circle		Longitude of ascending node of orbit plane at weekly epoch
C_is	f4	1 rad	_	Amplitude of the sine harmonic correction term to the angle of inclination
i_0	f8	1 semi-circle		Inclination angle at reference time

C_rc	f4	1 m	Amplitude of the cosine harmonic correction term to the orbit radius
omega	f8	1 semi-circle	Argument of perigee
OMEGADOT	f4	1 semi-circle / s	Rate of right ascension
IDOT	f4	1 semi-circle / s	Rate of inclination angle
WNt_oc	u2	1 week	BeiDou week number associated with t_oc, modulo 8192. Note that this value relates to the BeiDou system time.
WNt_oe	u2	1 week	BeiDou week number associated with t_oe, modulo 8192. Note that this values relates to the BeiDou system time.
Padding	u1[]		Padding bytes, see 4.1.5

BDSCNav1 Number: 4251
"OnChange" interval: block generated when a new data set is received

The BDSCNav1 block contains the B-CNAV1 navigation data decoded from the B1C signal of a BeiDou satellite.

Parameter	Туре	Units	Do-Not-Use	Description
Sync1	c1			·
Sync2	c1			
CRC	u2			Block Header, see 4.1.1
ID	u2			
Length	u2	1 byte		
TOW	u4	0.001 s	4294967295	SIS time stamp, see 4.1.3
WNc	u2	1 week	65535	Size time stamp, see 4.1.5
PRNidx	u1			PRN number of the satellite in the BeiDou constellation (1 for C01, 2 for C02, etc). Warning : this is the index within the constellation and not the global PRN number defined in 4.1.9.
Flags	u1			Bit field: Bits 0-1: Satellite type (1: GEO, 2: IGSO, 3: MEO).
				Bits 2-7: Reserved
t_oe	u4	1 s		Ephemeris reference time of week
A	f8	1 m		Semi-major axis at reference time (ΔA plus A_{ref})
A_DOT	f8	1 m / s		Change rate in semi-major axis (Å)
DELTA_n0	f4	1 semi-circle / s		Mean motion difference from computed value at reference time
DELTA_n0_DOT	f4	1 semi-circle / s ²		Rate of mean motion difference from computed value
M_0	f8	1 semi-circle		Mean anomaly
е	f8			Eccentricity
omega	f8	1 semi-circle		Argument of perigee
OMEGA_0	f8	1 semi-circle		Longitude of ascending node
OMEGADOT	f4	1 semi-circle / s		Rate of right ascension
i_0	f8	1 semi-circle		Inclination angle
IDOT	f4	1 semi-circle / s		Rate of inclination angle
C_is	f4	1 rad		Amplitude of the sine harmonic correction term to the angle of inclination
C_ic	f4	1 rad		Amplitude of the cosine harmonic correction term to the angle of inclination
C_rs	f4	1 m		Amplitude of the sine harmonic correction term to the orbit radius
C_rc	f4	1 m		Amplitude of the cosine harmonic correction term to the orbit radius
C_us	f4	1 rad		Amplitude of the sine harmonic correction term to the argument of latitude
C_uc	f4	1 rad		Amplitude of the cosine harmonic correction term to the argument of latitude
t_oc	u4	1 s		Clock correction parameters reference time
a_2	f4	1 s / s ²		Clock drift rate
a_1	f4	1 s / s		Clock drift
a_0	f8	1 s		Clock bias
t_op	u4	1 s		Time of week for data prediction
SISAI_ocb	u1			Satellite orbit radius and fixed satellite clock bias accuracy index (5-bit raw value without sign interpretation)

SISAI_oc12	u1		Bit field:
			Bits 0-2: SISAI_oc2: Satellite clock drift accuracy index
			Bits 3-5: SISAI_oc1: Satellite clock bias accuracy index
			Bits 6-7: Reserved
SISAI_oe	u1		Satellite orbit along-track and cross-track accuracy index (5-bit raw value without sign interpretation)
SISMAI	u1		Signal in space monitoring accuracy index
HealthIF	u1		Health and integrity flags:
			Bit 0: Accuracy integrity flag (AIF _(B1C))
			Bit 1: Signal integrity flag $(SIF_{(B1C)})$
			Bit 2: Data integrity flag ($DIF_{(B1C)}$)
			Bits 3-5: Reserved
			Bits 6-7: Satellite health status (0 if healthy)
IODE	u1		Issue Of Data Ephemeris
IODC	u2		Issue Of Data Clock
ISC_B1Cd	f4	1 s	Group delay differential between the B1C data and pilot components
T_GDB1Cp	f4	1 s	Group delay differential of the B1C pilot component
T_GDB2ap	f4	1 s	Group delay differential of the B2a pilot component
Padding	u1[]		Padding bytes, see 4.1.5

BDSCNav2 Number: 4252
"OnChange" interval: block generated when a new data set is received

The ${\tt BDSCNav2}$ block contains the B-CNAV2 navigation data decoded from the B2a signal of a BeiDou satellite.

Parameter	Type	Units	Do-Not-Use	Description
Sync1	c1			·
Sync2	c1			
CRC	u2			Block Header, see 4.1.1
ID	u2

WNc	u2	1 week	65535	SIS time stamp, see 4.1.3
PRNidx	u1			PRN number of the satellite in the BeiDou constellation (1 for C01, 2 for C02, etc). Warning: this is the index within the constellation and not the global PRN number defined in 4.1.9.
Flags	u1			Bit field: Bits 0-1: Satellite type (1: GEO, 2: IGSO, 3: MEO). Bits 2-7: Reserved
t_oe	u4	1 s		Ephemeris reference time of week
A	f8	1 m		Semi-major axis at reference time (ΔA plus A_{ref})
A_DOT	f8	1 m / s		Change rate in semi-major axis (Å)
DELTA_n0	f4	1 semi-circle / s		Mean motion difference from computed value at reference time
DELTA_n0_DOT	f4	1 semi-circle / s ²		Rate of mean motion difference from computed value
M_0	f8	1 semi-circle		Mean anomaly
е	f8			Eccentricity
omega	f8	1 semi-circle		Argument of perigee
OMEGA_0	f8	1 semi-circle		Longitude of ascending node
OMEGADOT	f4	1 semi-circle / s		Rate of right ascension
i_0	f8	1 semi-circle		Inclination angle
IDOT	f4	1 semi-circle / s		Rate of inclination angle
C_is	f4	1 rad		Amplitude of the sine harmonic correction term to the angle of inclination
C_ic	f4	1 rad		Amplitude of the cosine harmonic correction term to the angle of inclination
C_rs	f4	1 m		Amplitude of the sine harmonic correction term to the orbit radius
C_rc	f4	1 m		Amplitude of the cosine harmonic correction term to the orbit radius
C_us	f4	1 rad		Amplitude of the sine harmonic correction term to the argument of latitude
C_uc	f4	1 rad		Amplitude of the cosine harmonic correction term to the argument of latitude
t_oc	u4	1 s		Clock correction parameters reference time
a_2	f4	1 s / s ²		Clock drift rate
a_1	f4	1 s / s		Clock drift
a_0	f8	1 s		Clock bias
t_op	u4	1 s		Time of week for data prediction
SISAI_ocb	u1			Satellite orbit radius and fixed satellite clock bias accuracy index (5-bit raw value without sign interpretation)

		1		
SISAI_oc12	u1			Bit field:
				Bits 0-2: SISAI_oc2: Satellite clock drift accuracy index
				Bits 3-5: SISAI_oc1: Satellite clock bias accuracy index
				Bits 6-7: Reserved
SISAI_oe	u1			Satellite orbit along-track and cross-track accuracy index (5-bit raw value without sign interpretation)
SISMAI	u1			Signal in space monitoring accuracy index
HealthIF	u1			Health and integrity flags from the last message type used in this SBF block:
				Bit 0: Accuracy integrity flag (AIF _(B1C))
				Bit 1: Signal integrity flag ($SIF_{(B1C)}$)
				Bit 2: Data integrity flag (<i>DIF</i> _(B1C))
				Bit 3: Accuracy integrity flag (AIF _(B2a))
				Bit 4: Signal integrity flag (SIF _(B2a))
				Bit 5: Data integrity flag (<i>DIF</i> _(B2a))
				Bits 6-7: Satellite health status (0 if healthy)
IODE	u1			Issue Of Data Ephemeris
IODC	u2			Issue Of Data Clock
ISC_B2ad	f4	1 s	-2·10 ¹⁰	Group delay differential between the B2a data and pilot components
T_GDB2ap	f4	1 s	$-2 \cdot 10^{10}$	Group delay differential of the B2a pilot component
T_GDB1Cp	f4	1 s	-2·10 ¹⁰	Group delay differential of the B1C pilot component
Padding	u1[]			Padding bytes, see 4.1.5

BDSCNav3 Number: 4253
"OnChange" interval: block generated when a new data set is received

The ${\tt BDSCNav3}$ block contains the B-CNAV3 navigation data decoded from the B2b_I signal of a BeiDou satellite.

Parameter	Туре	Units	Do-Not-Use	Description
Sync1	c1			·
Sync2	c1

Health	u2			Satellite health information (9 bits)
Reserved	u1[2]			Reserved for future use, to be ignored by decoding software
Padding	u1[]			Padding bytes, see 4.1.5

BDSIon	Number:	4120		
	"OnChange"	interval: output each time the ionospheric parameters a	are	re-
		ceived from a BeiDou satellite		

The ${\tt BDSIon}$ block contains the BeiDou ionosphere data (the Klobuchar coefficients), as received from the D1 or D2 nav message.

Parameter	Туре	Units	Do-Not-Use	Description
Sync1	c1			
Sync2	c1			
CRC	u2			Block Header, see 4.1.1
ID	u2			
Length	u2	1 byte		
TOW	u4	0.001 s	4294967295	SIS time stamp, see 4.1.3
WNc	u2	1 week	65535	ors time stamp, see 4.1.5
PRN	u1			ID of the BeiDou satellite from which the coefficients have been received (see 4.1.9)
Reserved	u1			Reserved for future use, to be ignored by decoding software
alpha_0	f4	1 s		vertical delay coefficient 0
alpha_1	f4	1 s / semi-circle		vertical delay coefficient 1
alpha_2	f4	1 s / semi-circle ²		vertical delay coefficient 2
alpha_3	f4	1 s / semi-circle ³		vertical delay coefficient 3
beta_0	f4	1 s		model period coefficient 0
beta_1	f4	1 s / semi-circle		model period coefficient 1
beta_2	f4	1 s / semi-circle ²		model period coefficient 2
beta_3	f4	1 s / semi-circle ³		model period coefficient 3
Padding	u1[]			Padding bytes, see 4.1.5

BDSUtc	Number:	4121
	"OnChange"	interval: output each time the UTC offset parameters are received
		from a BeiDou satellite

The BDSUtc block contains the BeiDou UTC data, as received from the D1 or D2 nav message.

Note that BDT (BeiDou time) started on January 1st, 2006 (GPS week 1356). Therefore the delta time between BDT and UTC due to leap seconds is 14 less than the value in \mathtt{GPSUtc} .

Parameter	Туре	Units	Do-Not-Use	Description
Sync1	c1			
Sync2	c1

WNc	u2	1 week	65535	1313 time stamp, see 4.1.3
PRN	u1			ID of the BeiDou satellite from which the coefficients have been received (see 4.1.9)
Reserved	u1			Reserved for future use, to be ignored by decoding software
A_1	f4	1 s / s		first order term of polynomial
A_0	f8	1 s		constant term of polynomial
DEL_t_LS	i1	1 s		Delta time due to leap seconds whenever the effectivity time is not in the past
WN_LSF	u1	1 week		Effectivity time of leap second (week)
DN	u1	1 day		Effectivity time of leap second (day, from 0 to 6)
DEL_t_LSF	i1	1 s		Delta time due to leap seconds whenever the effectivity time is in the past
Padding	u1[]			Padding bytes, see 4.1.5

4.2.7 QZSS Decoded Message Blocks

QZSNav	Number:	4095	
	"OnChange"	interval: block generated each time a new navigation data set is	l
		received from a QZSS satellite	l

The QZSNav block contains the decoded navigation data for one QZSS satellite. The data is decoded from the navigation message transmitted by the L1C/A or L1C/B signal. Refer to the QZSS ICD for further details.

Parameter	Турє	Units	Do-Not-Use	Description
Sync1	c1			
Sync2	c1			
CRC	u2			Block Header, see 4.1.1
ID	u2			
Length	u2	1 byte		
TOW	u4	0.001 s	4294967295	SIS time stamp, see 4.1.3
WNc	u2	1 week	65535	one stamp, see 1.1.5
PRN	u1			ID of the QZSS satellite of which the ephemeris is given in this block (see 4.1.9)
Reserved	u1			Reserved for future use, to be ignored by decoding software
WN	u2	1 week	65535	Week number (10 bits from subframe 1, word 3)
CAorPonL2	u1			This is a bit field containing bits 71 and 72 from subframe 1:
				Bit 0: Bit 72 of subframe 1 (Ephemeris Status Flag).
				Bit 1: Bit 71 of subframe 1 (Reserved).
				Bits 2-7: Reserved
				Note that these bits were previously (in QZSS ICD is-qzss-pnt-004 and earlier) defined as "C/A or P on L2".
URA	u1			User Range accuracy index (4 bits from subframe 1 word 3)
health	u1			6-bit health from subframe 1, word 3 (6 bits from subframe 1, word 3)
L2DataFlag	u1			Data flag for L2 P-code (1 bit from subframe 1, word 4). Always 1 for QZSS satellites.
IODC	u2			Issue of data, clock (10 bits from subframe 1)
IODE2	u1			Issue of data, ephemeris (8 bits from subframe 2)
IODE3	u1			Issue of data, ephemeris (8 bits from subframe 3)
FitIntFlg	u1			Curve Fit Interval, (1 bit from subframe 2, word 10)
Reserved2	u1			unused, to be ignored by decoding software
T_gd	f4	1 s	$-2 \cdot 10^{10}$	Estimated group delay differential
t_oc	u4	1 s		clock data reference time
a_f2	f4	1 s / s ²		SV clock aging
a_f1	f4	1 s / s		SV clock drift
a_f0	f4	1 s		SV clock bias
C_rs	f4	1 m		Amplitude of the sine harmonic correction term to the orbit radius
DEL_N	f4	1 semi-circle / s		Mean motion difference from computed value
M_0	f8	1 semi-circle		Mean anomaly at reference time
C_uc	f4	1 rad		Amplitude of the cosine harmonic correction term to the argument of latitude
e	f8			Eccentricity
C_us	f4	1 rad		Amplitude of the sine harmonic correction term to the argument of latitude

SQRT_A	f8	1 m ^{1/2}	Square root of the semi-major axis
t_oe	u4	1 s	Reference time ephemeris
C_ic	f4	1 rad	Amplitude of the cosine harmonic correction term to the angle of inclination
OMEGA_0	f8	1 semi-circle	Longitude of ascending node of orbit plane at weekly epoch
C_is	f4	1 rad	Amplitude of the sine harmonic correction term to the angle of inclination
i_0	f8	1 semi-circle	Inclination angle at reference time
C_rc	f4	1 m	Amplitude of the cosine harmonic correction term to the orbit radius
omega	f8	1 semi-circle	Argument of perigee
OMEGADOT	f4	1 semi-circle / s	Rate of right ascension
IDOT	f4	1 semi-circle / s	Rate of inclination angle
WNt_oc	u2	1 week	WN associated with t_oc, modulo 1024
WNt_oe	u2	1 week	WN associated with t_oe, modulo 1024
Padding	u1[]		Padding bytes, see 4.1.5

QZSAlm Number: 4116
"OnChange" interval: block generated each time a new almanac data set is received from a QZSS satellite

The QZSAlm block contains the decoded almanac data for one QZSS satellite. These data are conveyed in subframes 4 and 5 of the satellite navigation message. Refer to QZSS ICD for further details.

Parameter	Туре	Units	Do-Not-Use	Description
Sync1	c1			
Sync2	c1			
CRC	u2			Block Header, see 4.1.1
ID	u2			
Length	u2	1 byte		
TOW	u4	0.001 s	4294967295	SIS time stamp, see 4.1.3
WNc	u2	1 week	65535	or time stamp, see 1.1.5
PRN	u1			ID of the QZSS satellite of which the almanac is given in this block (see 4.1.9)
Reserved	u1			Reserved for future use, to be ignored by decoding software
е	f4			Difference from reference eccentricity
t_oa	u4	1 s		almanac reference time of week
delta_i	f4	1 semi-circle		Difference from reference angle of inclination
OMEGADOT	f4	1 semi-circle / s		Rate of right ascension
SQRT_A	f4	1 m ^{1/2}		Square root of the semi-major axis
OMEGA_0	f4	1 semi-circle		Longitude of ascending node of orbit plane at weekly epoch
omega	f4	1 semi-circle		Argument of perigee
M_0	f4	1 semi-circle		Mean anomaly at reference time
a_f1	f4	1 s / s		SV clock drift
a_f0	f4	1 s		SV clock bias
WN_a	u1	1 week		Almanac reference week, to which t_oa is referenced
Reserved2	u1			Reserved for future use, to be ignored by decoding software
health8	u1			health on 8 bits from the almanac page
health6	u1			health summary on 6 bits (from subframe 4, page 25 and subframe 5 page 25)
Padding	u1[]			Padding bytes, see 4.1.5

4.2.8 NavIC/IRNSS Decoded Message Blocks

NavICLNav	Number:	4254
	"OnChange"	interval: block generated each time a new navigation data set
		is received from a NavIC satellite

The ${\tt NavICLNav}$ block contains the decoded LNAV navigation data for one NavIC/IRNSS satellite.

Parameter	Туре	Units	Do-Not-Use	Description
Sync1	c1			
Sync2	c1			
CRC	u2			Block Header, see 4.1.1
ID	u2			
Length	u2	1 byte		
TOW	u4	0.001 s	4294967295	CIS time stamp see 4.1.2
WNc	u2	1 week	65535	SIS time stamp, see 4.1.3
PRNidx	u1			PRN number of the satellite in the NavIC/IRNSS constellation (1 for I01, 2 for I02, etc). Warning: this is the index within the constellation and not the global PRN number defined in 4.1.9.
IODEC	u1			lssue of data, ephemeris and clock
t_oe	u4	1 s		Ephemeris reference time of week
SQRT_A	f8	1 m ^{1/2}		Square root of the semi-major axis
DELTA_N	f4	1 semi-circle / s		Mean motion difference from computed value at reference time
M_0	f8	1 semi-circle		Mean anomaly
e	f8			Eccentricity
omega	f8	1 semi-circle		Argument of perigee
OMEGA_0	f8	1 semi-circle		Longitude of ascending node
OMEGADOT	f4	1 semi-circle / s		Rate of right ascension
	- 1			
i_0	f8	1 semi-circle		Inclination angle
IDOT	f4	1 semi-circle / s		Rate of inclination angle
C_is	f4	1 rad		Amplitude of the sine harmonic correction term to the angle of inclination
C_ic	f4	1 rad		Amplitude of the cosine harmonic correction term to the angle of inclination
C_rs	f4	1 m		Amplitude of the sine harmonic correction term to the orbit radius
C_rc	f4	1 m		Amplitude of the cosine harmonic correction term to the orbit radius
C_us	f4	1 rad		Amplitude of the sine harmonic correction term to the argument of latitude
C_uc	f4	1 rad		Amplitude of the cosine harmonic correction term to the argument of latitude
t_oc	u4	1 s		Clock correction parameters reference time
a_f0	f4	1 s		Clock bias
a_f1	f4	1 s / s		Clock drift
a_f2	f4	1 s / s ²		Clock drift rate
T_GD	f4	1 s		Total group delay between L5-SPS and S-SPS signals
Flags	u1			Health, Alert and AutoNav flags:
				Bit 0: S-SPS health flag (0 if healthy)
				Bit 1: L5-SPS health flag (0 if healthy)
				Bit 2: Current value of the Alert flag
				Bit 3: Current value of the AutoNav flag
				Bits 4-7: Reserved
URA	u1			User Range accuracy index
Padding	u1[]			Padding bytes, see 4.1.5

4.2.9 SBAS L1 Decoded Message Blocks

GEOMT00	Number:	5925
	"OnChange"	interval: block generated each time an empty MT00 is received
		from an SBAS satellite on the L1 signal

This block is sent to indicate that an empty SBAS message type 0 has been received.

Depending on the SBAS operational mode, message type 0 can contain the contents of message type 2. Upon reception of a message type 0, the receiver checks whether the message is empty (it contains only 0's) or whether it contains the message type 2 contents. In the former case, a <code>GEOMT00</code> block will be generated. In the latter case, a <code>GEOFastCorr</code> block will be generated. Refer to section A.4.4.1 of the DO 229 standard for further details.

Parameter	Туре	Units	Do-Not-Use	Description
Sync1	c1			
Sync2	c1			
CRC	u2			Block Header, see 4.1.1
ID	u2			
Length	u2	1 byte		
TOW	u4	0.001 s	4294967295	CIS time stamp, see 4.1.2
WNc	u2	1 week	65535	SIS time stamp, see 4.1.3
PRN	u1			ID of the SBAS satellite from which the message has been received (see 4.1.9)
Padding	u1[]			Padding bytes, see 4.1.5

GEOPRNMask N	Number:	5926
T .	'OnChange"	interval: block generated each time MT01 is received from an SBAS satellite

This block contains the decoded PRN mask transmitted in SBAS message type 1. Refer to section A.4.4.2 of the DO 229 standard for further details.

Parameter	Туре	Units	Do-Not-Use	Description
Sync1	c1			
Sync2	c1			
CRC	u2			Block Header, see 4.1.1
ID	u2			
Length	u2	1 byte		
TOW	u4	0.001 s	4294967295	SIS time stamp, see 4.1.3
WNc	u2	1 week	65535	1515 time stamp, see 4.1.5
PRN	u1			ID of the SBAS satellite from which the message has been received (see 4.1.9)
IODP	u1			Issue of data - PRN.
NbrPRNs	u1			Number of PRNs designated in the mask.
PRNMask	u1[NbrPRNs]			List of the PRNs in the PRN mask. $ \label{eq:prnmask} {\tt PRNMask[0]} \mbox{ is the first PRN designated in the PRN mask (from 1 to 210),} \\ {\tt PRNMask[1]} \mbox{ is the $2^{\rm nd}$ PRN designated in the PRN mask,} \\ {\tt etc} $
Padding	u1[]			Padding bytes, see 4.1.5

GEOFastCorr	Number:	5927
	"OnChange"	interval: block generated each time MT02, MT03, MT04
		MT05, MT24 and possibly MT00 is received from
		an SBAS satellite

This block contains the decoded fast corrections transmitted in the SBAS message types 2, 3, 4, 5, 24 and possibly 0 if the type 0 message contains the type 2 contents. Refer to section A.4.4.3 and A.4.4.8 of the DO 229 standard for further details.

Parameter	Туре	Units	Do-Not-Use	Description
Sync1	c1			
Sync2	c1			
CRC	u2			Block Header, see 4.1.1
ID	u2			
Length	u2	1 byte		
TOW	u4	0.001 s	4294967295	SIS time stamp, see 4.1.3
WNc	u2	1 week	65535	ois time stamp, see 4.1.5
PRN	u1			ID of the SBAS satellite from which the message has been received (see 4.1.9)
MT	u1			Message type from which these fast corrections come, either 0, 2, 3, 4, 5 or 24.
IODP	u1			Issue of data - PRN.
IODF	u1			Issue of data - fast corrections.
N	u1			Number of fast correction sets in this message. This is the number of FastCorr sub-blocks. N depends on the message type as follows. Message type MT00, MT02, MT03, MT04 13 MT05 12 MT24 6
SBLength	u1			Length of the FastCorr sub-blocks in bytes
FastCorr				A succession of N FastCorr sub-blocks, see definition below
Padding	u1[]			Padding bytes, see 4.1.5

FastCorr sub-block definition:

Parameter	Туре	Units	Description			
PRNMaskNo	u1		Sequence number in the PRN mask. This field may be set to zero. In that case, all following fields in this sub-block must be discarded.			
UDREI	u1		User Differential Range Error Indicator for the PRN at index PRNMaskNo.			
Reserved	u1[2]		Reserved for future use, to be ignored by decoding software			
PRC	f4	1 m	Pseudorange correction for the PRN at index PRNMaskNo.			
Padding	u1[]		Padding bytes, see 4.1.5			

GEOIntegrity	Number:	5928					
	"OnChange"	interval: block generated	each t	ime	MT06	is	received
		from an SBAS sat	ellite				

This block contains the decoded integrity information transmitted in SBAS message type 6. Refer to section A.4.4.4 of the DO-229 standard for further details.

Parameter	Туре	Units	Do-Not-Use	Description
Sync1	c1			
Sync2	c1			
CRC	u2			Block Header, see 4.1.1
ID	u2			
Length	u2	1 byte		
TOW	u4	0.001 s	4294967295	SIS time stamp, see 4.1.3
WNc	u2	1 week	65535	313 time stamp, see 4.1.3
PRN	u1			ID of the SBAS satellite from which the message has been received (see 4.1.9)
Reserved	u1			Reserved for future use, to be ignored by decoding software
IODF	u1[4]			Issue of data - fast corrections for MT02, MT03, MT04 and MT05.
UDREI	u1[51]			User Differential Range Error Indicator for each of the 51 slots in the PRN mask.
Padding	u1[]			Padding bytes, see 4.1.5

GEOFastCorrDegr	Number:	5929
	"OnChange"	interval: block generated each time MT07 is re-
		ceived from an SBAS satellite

This block contains the decoded fast correction degradation factors transmitted in SBAS message type 7. Refer to section A.4.4.5 of the DO-229 standard for further details.

Parameter	Туре	Units	Do-Not-Use	Description		
Sync1	c1					
Sync2	c1					
CRC	u2			Block Header, see 4.1.1		
ID	u2					
Length	u2	1 byte				
TOW	u4	0.001 s	4294967295	SIS time stamp, see 4.1.3		
WNc	u2	1 week	65535	Sis time stamp, see 4.1.5		
PRN	u1			ID of the SBAS satellite from which the message has been received (see 4.1.9)		
IODP	u1			Issue of data - PRN.		
t_lat	u1	1 s		System latency.		
ai	u1[51]			Degradation factor indicator (from 0 to 15) for each of the 51 slots in the PRN mask.		
Padding	u1[]			Padding bytes, see 4.1.5		

GEONav	Number:	5896
	"OnChange"	interval: block generated each time MT09 is received from an SBAS
		satellite

This block contains the decoded navigation data transmitted in SBAS message type 9. Refer to section A.4.4.11 of the DO-229 standard for further details.

Parameter	Туре	Units	Do-Not-Use	Description
Sync1	c1			
Sync2	c1			
CRC	u2			Block Header, see 4.1.1
ID	u2			
Length	u2	1 byte		
TOW	u4	0.001 s	4294967295	SIS time stamp, see 4.1.3
WNc	u2	1 week	65535	or time stamp, see 1.7.5
PRN	u1			ID of the SBAS satellite of which the navigation data is provided here (see 4.1.9)
Reserved	u1			Reserved for future use, to be ignored by decoding software
IODN	u2			Issue of data - navigation (DO 229-B) Spare (DO 229-C)
URA	u2			Accuracy exponent
t0	u4	1 s		Time of applicability (time-of-day)
Xg	f8	1 m		X position at time-of-day t 0
Yg	f8	1 m		Y position at time-of-day t 0
Zg	f8	1 m		Z position at time-of-day t0
Xgd	f8	1 m / s		X velocity at time-of-day t 0
Ygd	f8	1 m / s		Y velocity at time-of-day t 0
Zgd	f8	1 m / s		Z velocity at time-of-day t0
Xgdd	f8	1 m / s ²		X acceleration at time-of-day t 0
Ygdd	f8	1 m / s ²		Y acceleration at time-of-day t 0
Zgdd	f8	1 m / s ²		Z acceleration at time-of-day t 0
aGf0	f4	1 s		Time offset with respect to SBAS network time
aGf1	f4	1 s / s		Time drift with respect to SBAS network time
Padding	u1[]			Padding bytes, see 4.1.5

GEODegrFactors	Number:	5930						
	"OnChange"	interval: block	generated	each	time	MT10	is	re-
	ceived from an SBAS satellite							

This block contains the decoded degradation factors transmitted in SBAS message type 10. Refer to section A.4.5 of the DO-229 standard for further details.

Parameter	Туре	Units	Do-Not-Use	Description
Sync1	c1			·
Sync2	c1			
CRC	u2			Block Header, see 4.1.1
ID	u2			
Length	u2	1 byte		
TOW	u4	0.001 s	4294967295	SIS time stamp, see 4.1.3
WNc	u2	1 week	65535	
PRN	u1			ID of the SBAS satellite from which the message has been received (see 4.1.9)
Reserved	u1			Reserved for future use, to be ignored by decoding software
Brrc	f8	1 m		A parameter associated with the relative estimation noise and round-off error.
Cltc_lsb	f8	1 m		Maximum round-off error due to the LSB resolution of the orbit and clock information.
Cltc_v1	f8	1 m / s		Velocity error bound on the maximum range rate difference of missed messages due to clock and orbit rate differences.
Iltc_v1	u4	1 s		Update interval for long term corrections when the velocity code is 1.
Cltc_v0	f8	1 m		Bound on the update delta between successive long term corrections.
Iltc_v0	u4	1 s		Minimum update interval for long term messages when the velocity code is 0.
Cgeo_lsb	f8	1 m		Maximum round-off error due to the LSB resolution of the orbit and clock information.
Cgeo_v	f8	1 m / s		Velocity error bound on the maximum range rate difference of missed messages due to clock and orbit rate differences.
Igeo	u4	1 s		Update interval for GEO navigation messages.
Cer	f4	1 m		A degradation parameter.
Ciono_step	f8	1 m		Bound on the difference between successive ionospheric grid delay values.
Iiono	u4	1 s		Minimum update interval for ionospheric correction messages.
Ciono_ramp	f8	1 m / s		Rate of change of the ionospheric corrections.
RSSudre	u1			Root-sum-square flag (UDRE)
RSSiono	u1			Root-sum-square flag (IONO)
Reserved2	u1[2]			Reserved for future use, to be ignored by decoding software
Ccovariance	f8			A parameter used to compensate for the errors introduced by quantization (introduced in DO 229-C). To be multiplied by the SF parameter from the GEOClockEphCovMatrix block.
Padding	u1[]			Padding bytes, see 4.1.5

GEONetworkTime	Number:	5918						
	"OnChange"	interval: block	generated	each	time	MT12	is	re-
		ceived	from an SE	BAS sat	tellite			

This block contains the decoded network time offset parameters transmitted in SBAS message type 12. Refer to section A.4.4.15 of the DO-229 standard for further details.

Parameter	Туре	Units	Do-Not-Use	Description
Sync1	c1			
Sync2	c1			
CRC	u2			Block Header, see 4.1.1
ID	u2			
Length	u2	1 byte		
TOW	u4	0.001 s	4294967295	SIS time stamp, see 4.1.3
WNc	u2	1 week	65535	ois time stamp, see 4.1.5
PRN	u1			ID of the SBAS satellite from which this Network Time data was received (see 4.1.9)
Reserved	u1			Reserved for future use, to be ignored by decoding software
A_1	f4	1 s / s		first order term of polynomial
A_0	f8	1 s		constant term of polynomial
t_ot	u4	1 s		reference time for UTC data (time of week)
WN_t	u1	1 week		UTC reference week number, to which t_ot is referenced
DEL_t_LS	i1	1 s		Delta time due to leap seconds whenever the effectivity time is not in the past
WN_LSF	u1	1 week		Effectivity time of leap second (week)
DN	u1	1 day		Effectivity time of leap second (day)
DEL_t_LSF	i1	1 s		Delta time due to leap seconds whenever the effectivity time is in the past
UTC_std	u1			UTC Standard Identifier
GPS_WN	u2	1 week		GPS week number (modulo 1024)
GPS_TOW	u4	1 s		GPS time-of-week
GlonassID	u1			Glonass Indicator
Padding	u1[]			Padding bytes, see 4.1.5

GEOAlm	Number:	5897	1
	"OnChange"	interval: block generated each time MT17 is received from an SBAS	,
		satellite	

This block contains the decoded almanac data for one SBAS satellite, as transmitted in SBAS message type 17. A different GEOAlm block is generated for each of the up to three almanac data sets in MT17. Refer to section A.4.4.12 of the DO-229 standard for further details.

Parameter	Туре	Units	Do-Not-Use	Description
Sync1	c1			
Sync2	c1			
CRC	u2			Block Header, see 4.1.1
ID	u2			
Length	u2	1 byte		
TOW	u4	0.001 s	4294967295	SIS time stamp, see 4.1.3
WNc	u2	1 week	65535	ois time stamp, see 1.1.5
PRN	u1			ID of the SBAS satellite of which the almanac is provided here (see 4.1.9)
Reserved0	u1			Reserved for future use, to be ignored by decoding software
DataID	u1			Data ID
Reserved1	u1			Reserved for future use, to be ignored by decoding software
Health	u2			Health bits
t_oa	u4	1 s		Time of applicability with the day ambiguity resolved. This is the time in GPS seconds from Jan 6th, 1980.
Xg	f8	1 m		X position at t_oa
Yg	f8	1 m		Y position at t_oa
Zg	f8	1 m		Z position at t_oa
Xgd	f8	1 m / s		X velocity at t_oa
Ygd	f8	1 m / s	_	Y velocity at t_oa
Zgd	f8	1 m / s		Z velocity at t_oa
Padding	u1[]			Padding bytes, see 4.1.5

GEOIGPMask	Number:	5931
	"OnChange"	interval: block generated each time MT18 is received from
		an SBAS satellite

This block contains the decoded ionospheric grid point mask transmitted in SBAS message type 18. Refer to section A.4.4.9 of the DO-229 standard for further details.

Parameter	Туре	Units	Do-Not-Use	Description
Sync1	c1			
Sync2	c1			
CRC	u2			Block Header, see 4.1.1
ID	u2			
Length	u2	1 byte		
TOW	u4	0.001 s	4294967295	SIS time stamp, see 4.1.3
WNc	u2	1 week	65535	Sis time stamp, see 4.1.5
PRN	u1			ID of the SBAS satellite from which the message has been received (see 4.1.9)
NbrBands	u1			Number of bands being broadcast.
BandNbr	u1			Band number.
IODI	u1			Issue of data - ionosphere.
NbrIGPs	u1			Number of ionospheric grid points (IGP) designated in the mask.
IGPMask	u1[NbrlGPs]			List of the IGPs in the IGP mask. $ \begin{tabular}{l} IGPMask [0] is the first IGP designated in the IGP mask (from 1 to 201), \\ IGPMask [1] is the 2^{nd} IGP designated in the IGP mask, etc \end{tabular} $
Padding	u1[]			Padding bytes, see 4.1.5

GEOLongTermCorr	Number:	5932
	"OnChange"	interval: block generated each time MT24 or MT25
		is received from an SBAS satellite

This block contains the decoded long term corrections transmitted in SBAS message types 24 and 25. Refer to section A.4.4.7 and A.4.4.8 of the DO-229 standard for further details.

Parameter	Туре	Units	Do-Not-Use	Description		
Sync1	c1					
Sync2	c1					
CRC	u2			Block Header, see 4.1.1		
ID	u2					
Length	u2	1 byte				
TOW	u4	0.001 s	4294967295	CIC time storm see 4.1.2		
WNc	u2	1 week	65535	SIS time stamp, see 4.1.3		
PRN	u1			ID of the SBAS satellite from which the message has been received (see 4.1.9)		
N	u1			Number of long-term corrections in this message. This is the number of LTCorr sub-blocks. $\mathbb N$ can be 0, 1, 2, 3 or 4.		
SBLength	u1	1 byte		Length of the LTCorr sub-blocks in bytes		
Reserved	u1[3]			Reserved for future use, to be ignored by decoding software		
LTCorr				A succession of N LTCorr sub-blocks, see definition below		
Padding	u1[]			Padding bytes, see 4.1.5		

LTCorr sub-block definition:

Parameter	Туре	Units	Description
VelocityCode	u1		Velocity code (0 or 1)
PRNMaskNo	u1		Sequence in the PRN mask, from 1 to 51. Note that if the PRN mask No. from the original message is 0, the corresponding long term corrections are ignored, and hence not included in the GEOLongTermCorr block.
IODP	u1		Issue of data - PRN.
IODE	u1		lssue of data - ephemeris.
dx	f4	1 m	Satellite position offset (x).
dy	f4	1 m	Satellite position offset (y).
dz	f4	1 m	Satellite position offset (z).
dxRate	f4	1 m / s	Satellite velocity offset (x), or 0.0 if VelocityCode is 0.
dyRate	f4	1 m / s	Satellite velocity offset (y), or 0.0 if VelocityCode is 0.
dzRate	f4	1 m / s	Satellite velocity offset (z), or 0.0 if VelocityCode is 0.
da_f0	f4	1 s	Satellite clock offset.
da_f1	f4	1 s / s	Satellite drift correction, or 0.0 if VelocityCode is 0.
t_oe	u4	1 s	Time-of-day of applicability, or 0 if VelocityCode is 0.
Padding	u1[]		Padding bytes, see 4.1.5

GEOIonoDelay	Number:	5933					
	"OnChange"	interval: block generated	each ti	ime	MT26	is	received
		from an SBAS sat	ellite				

This block contains the decoded ionospheric delays transmitted in SBAS message type 26. Refer to section A.4.4.10 of the DO-229 standard for further details.

Parameter	Туре	Units	Do-Not-Use	Description	
Sync1	c1				
Sync2	c1				
CRC	u2			Block Header, see 4.1.1	
ID	u2				
Length	u2	1 byte			
TOW	u4	0.001 s	4294967295	SIS time stamp, see 4.1.3	
WNc	u2	1 week	65535	Job time stamp, see 4.1.5	
PRN	u1			ID of the SBAS satellite from which the message has been received (see 4.1.9)	
BandNbr	u1			Band number	
IODI	u1			Issue of data - ionosphere.	
N	u1			Number of ionospheric delay corrections in this message. This is the number of IDC sub-blocks. $\mathbb N$ is always 15.	
SBLength	u1	1 byte		Length of the IDC sub-blocks in bytes.	
Reserved	u1			Reserved for future use, to be ignored by decoding software	
IDC				A succession of N IDC sub-blocks, see definition below	
Padding	u1[]			Padding bytes, see 4.1.5	

IDC sub-block definition:

Parameter	Туре	Units	Description
IGPMaskNo	u1		Sequence number in the IGP mask (see <code>GEOIGPMask</code> block), from 1 to 201.
GIVEI	u1		Grid Ionospheric Vertical Error Indicator, from 0 to 15
Reserved	u1[2]		Reserved for future use, to be ignored by decoding software
VerticalDelay	f4	1 m	IGP vertical delay estimate.
Padding	u1[]		Padding bytes, see 4.1.5

GEOServiceLevel	Number:	5917
	"OnChange"	interval: block generated each time MT27 is re-
		ceived from an SBAS satellite

This block contains a decoded service level message for a geostationary SBAS satellite as sent in message type 27. Refer to section A.4.4.13 of the DO-229 standard for further details.

Parameter	Туре	Units	Do-Not-Use	Description
Sync1	c1			
Sync2	c1			
CRC	u2			Block Header, see 4.1.1
ID	u2			
Length	u2	1 byte		
TOW	u4	0.001 s	4294967295	SIS time stamp, see 4.1.3
WNc	u2	1 week	65535	515 time stamp, see 1.1.5
PRN	u1			ID of the SBAS satellite from which this service level message was received (see 4.1.9)
Reserved	u1			Reserved for future use, to be ignored by decoding software
IODS	u1			Issue of Data Service level, ranging from 0 to 7
nrMessages	u1			Number of service messages (MT27), from 1 to 8
MessageNR	u1			Service message number, from 1 to 8
PriorityCode	u1			Priority Code, from 0 to 3
dUDREI_In	u1			δ UDRE Indicator for users inside the service region, from 0 to 15
dUDREI_Out	u1			δ UDRE Indicator for users outside the service region, from 0 to 15
N	u1			Number of Regions in this message. This is the number of ServiceRegion sub-blocks. Ranging from 0 to 7
SBLength	u1	1 byte		Length of the ServiceRegion sub-blocks in bytes
Regions				A succession of N ServiceRegion sub-blocks, see definition below
Padding	u1[]			Padding bytes, see 4.1.5

ServiceRegion sub-block definition:

Parameter	Туре	Units	Description
Latitude1	i1	1 degree	Coordinate 1 latitude, from -90 to +90
Latitude2	i1	1 degree	Coordinate 2 latitude, from -90 to +90
Longitude1	i2	1 degree	Coordinate 1 longitude, from -180 to +180
Longitude2	i2	1 degree	Coordinate 2 longitude, from -180 to +180
RegionShape	u1		Region Shape: 0=triangular, 1=square
Padding	u1[]		Padding bytes, see 4.1.5

GEOClockEphCovMatrix	Number:	5934
	"OnChange"	interval: block generated each time MT28
		is received from an SBAS satel-
		lite

This block contains the decoded clock-ephemeris covariance Cholesky factor matrix transmitted in SBAS message type 28. Refer to section A.4.4.16 of the DO-229 standard for further details.

Parameter	Туре	Units	Do-Not-Use	Description
Sync1	c1			
Sync2	c1			
CRC	u2			Block Header, see 4.1.1
ID	u2			
Length	u2	1 byte		
TOW	u4	0.001 s	4294967295	SIS time stamp, see 4.1.3
WNc	u2	1 week	65535	Job time stamp, see 4.1.5
PRN	u1			Satellite ID, see 4.1.9
IODP	u1			Issue of data - PRN.
N	u1			Number of covariance matrices in this message. This is the number of $CovMatrix$ sub-blocks. N can be 1 or 2.
SBLength	u1	1 byte		Length of the CovMatrix sub-blocks in bytes
Reserved	u1[2]			Reserved for future use, to be ignored by decoding software
CovMatrix				A succession of N CovMatrix sub-blocks, see definition below
Padding	u1[]			Padding bytes, see 4.1.5

CovMatrix sub-block definition:

Parameter	Type Units	Description
PRNMaskNo	u1	Sequence number in the PRN mask, from 1 to 51. Note that if the PRN mask No. from the original message is 0, the corresponding matrix is ignored, and hence not included in the GEOClockEphCovMatrix block.
Reserved	u1[2]	Reserved for future use, to be ignored by decoding software
ScaleExp	u1	Scale exponent; scale factor (= $2^{\text{(scale exponent - 5)}}$)
E11	u2	E _{1,1}
E22	u2	$E_{2,2}$
E33	u2	E _{3,3}
E44	u2	E _{4,4}
E12	i2	$E_{1,2}$
E13	i2	$E_{1,3}$
E14	i2	E _{1,4}
E23	i2	$E_{2,3}$
E24	i2	$E_{2,4}$
E34	i2	E _{3,4}
Padding	u1[]	Padding bytes, see 4.1.5

4.2.10 GNSS Position, Velocity and Time Blocks

PVTCartesian	Number:	4006
	"OnChange"	interval: default PVT output rate (see 4.1.8)

This block contains the GNSS-based position, velocity and time (PVT) solution at the time specified in the ${\tt TOW}$ and ${\tt WNC}$ fields. The time of applicability is specified in the receiver time frame.

The computed position (x, y, z) and velocity (v_x, v_y, v_z) are reported in a Cartesian coordinate system using the datum indicated in the Datum field. The position is that of the marker. The ARP-to-marker offset is set through the command **setAntennaOffset**.

The PVT solution is also available in ellipsoidal form in the PVTGeodetic block.

The variance-covariance information associated with the reported PVT solution can be found in the PosCovCartesian and VelCovCartesian blocks.

If no PVT solution is available, the Error field indicates the cause of the unavailability and all fields after the Error field are set to their respective Do-Not-Use values.

Parameter	Туре	Units	Do-Not-Use	Description
Sync1	c1			
Sync2	c1			
CRC	u2			Block Header, see 4.1.1

3

PVTGeodetic	Number:	4007
	"OnChange"	interval: default PVT output rate (see 4.1.8)

This block contains the GNSS-based position, velocity and time (PVT) solution at the time specified in the ${\tt TOW}$ and ${\tt WNC}$ fields. The time of applicability is specified in the receiver time frame.

The computed position (ϕ, λ, h) and velocity (v_n, v_e, v_u) are reported in an ellipsoidal coordinate system using the datum indicated in the Datum field. The velocity vector is expressed relative to the local-level Cartesian coordinate frame with north-, east-, up-unit vectors. The position is that of the marker. The ARP-to-marker offset is set through the command **setAntennaOffset**.

The PVT solution is also available in Cartesian form in the PVTCartesian block.

The variance-covariance information associated with the reported PVT solution can be found in the PosCovGeodetic and VelCovGeodetic blocks.

If no PVT solution is available, the Error field indicates the cause of the unavailability and all fields after the Error field are set to their respective Do-Not-Use values.

PosCovCartesian	Number:	5905	
	"OnChange"	interval: default PVT output rate (see 4.1.8)	١

This block contains the elements of the symmetric variance-covariance matrix of the position expressed relative to the Cartesian axes of the coordinate system datum requested by the user:

$$\begin{pmatrix} \sigma_{x}^{2} & \sigma_{xy} & \sigma_{xz} & \sigma_{xb} \\ \sigma_{yx} & \sigma_{y}^{2} & \sigma_{yz} & \sigma_{yb} \\ \sigma_{zx} & \sigma_{zy} & \sigma_{z}^{2} & \sigma_{zb} \\ \sigma_{bx} & \sigma_{by} & \sigma_{bz} & \sigma_{b}^{2} \end{pmatrix}$$

This variance-covariance matrix contains an indication of the accuracy of the estimated parameters (see diagonal elements) and the correlation between these estimates (see off-diagonal elements). Note that the variances and covariances are estimated: they are not necessarily indicative of the actual scatter of the position estimates at a given site.

The position variance results from the propagation of all pseudorange variances using the observation geometry. The receiver implements a stochastic error model for individual measurements, based on parameters such as the C/N_0 , the satellite elevation, the pseudorange type, the URA of the broadcast ephemeris and the ionospheric model.

If the ellipsoidal height is not estimated (2D-mode), all components of the variance-covariance matrix are undefined and set to their Do-Not-Use value.

PosCovGeodetic	Number:	5906
	"OnChange"	interval: default PVT output rate (see 4.1.8)

This block contains the elements of the symmetric variance-covariance matrix of the position expressed in the geodetic coordinates in the datum requested by the user:

$$\begin{pmatrix} \sigma_{\phi}^{2} & \sigma_{\phi\lambda} & \sigma_{\phi h} & \sigma_{\phi b} \\ \sigma_{\lambda\phi} & \sigma_{\lambda}^{2} & \sigma_{\lambda h} & \sigma_{\lambda b} \\ \sigma_{h\phi} & \sigma_{h\lambda} & \sigma_{h}^{2} & \sigma_{hb} \\ \sigma_{b\phi} & \sigma_{b\lambda} & \sigma_{bh} & \sigma_{b}^{2} \end{pmatrix}$$

Please refer to the PosCovCartesian block description for a general explanation of the contents.

Note that the units of measure for all the variances and covariances, for height as well as for latitude and longitude, are m^2 for ease of interpretation.

If the ellipsoidal height is not estimated (2D-mode), all height related components of the variance-covariance matrix are undefined and set to their Do-Not-Use value.

Padding	u1[]			Padding bytes, see 4.1.5

VelCovGeodetic	Number:	5908	
	"OnChange"	interval: default PVT output rate (see 4.1.8)	١

This block contains the elements of the symmetric variance-covariance matrix of the velocity expressed in the geodetic coordinates in the datum requested by the user:

$$\begin{pmatrix} \sigma_{V_N}^2 & \sigma_{V_N V_E} & \sigma_{V_N V_U} & \sigma_{V_N d} \\ \sigma_{V_E V_N} & \sigma_{V_E}^2 & \sigma_{V_E V_U} & \sigma_{V_E d} \\ \sigma_{V_U V_N} & \sigma_{V_U V_E} & \sigma_{V_U}^2 & \sigma_{V_U d} \\ \sigma_{d V_N} & \sigma_{d V_E} & \sigma_{d V_U} & \sigma_{d}^2 \end{pmatrix}$$

Please refer to the PosCovCartesian block description for a general explanation of the contents.

If the up-velocity is not estimated (2D-mode), all up-velocity related components of the variance-covariance matrix are undefined and set to their Do-Not-Use value.

DOP Number: 4001

"OnChange" interval: default PVT output rate (see 4.1.8)

This block contains both Dilution of Precision (DOP) values and SBAS protection levels. The DOP values result from a trace of the unit position variance-covariance matrices:

Position Dilution of Precision: $PDOP = \sqrt{\mathbf{Q}_{xx} + \mathbf{Q}_{yy} + \mathbf{Q}_{zz}}$

Time Dilution of Precision: $TDOP = \sqrt{\mathbf{Q}_{bb}}$

Horizontal Dilution of Precision: $HDOP = \sqrt{\mathbf{Q}_{\lambda\lambda} + \mathbf{Q}_{\phi\phi}}$

Vertical Dilution of Precision: $VDOP = \sqrt{\mathbf{Q}_{hh}}$

In these equations, the matrix \mathbf{Q} is the inverse of the unweighted normal matrix used for the computation of the position. The normal matrix equals the product of the geometry matrix A with its transpose (A^tA). The term "unweighted" implies that the DOP factor only addresses the effect of the geometric factors on the quality of the position.

The DOP values can be used to interpret the current constellation geometry. This is an important parameter for the quality of the position fix: the DOP parameter is the propagation factor of the pseudorange variance. For example, if an error of 5 m is present in the pseudorange, it will propagate into the horizontal plane with a factor expressed by the HDOP. Hence a low DOP value indicates that the satellites used for the position fix result in a low multiplication of the systematic ranging errors. A value of six (6) for the PDOP is generally considered as the maximum value allowed for an acceptable position computation.

The horizontal and vertical protection levels (HPL and VPL) indicate the integrity of the computed horizontal and vertical position components as per the DO 229 specification. In SBAS-aided PVT mode (see the Mode field of the PVTCartesian SBF block), HPL and VPL are based upon the error estimates provided by SBAS. Otherwise they are based upon internal position-mode dependent error estimates.

PosCart	Number:	4044	
	"OnChange"	interval: default PVT output rate (see 4.1.8)	

This block contains the absolute and relative (relative to the nearest base station) position at the time specified in the ${\tt TOW}$ and ${\tt WNC}$ fields. The time of applicability is specified in the receiver time frame.

The absolute position (X, Y, Z) is reported in a Cartesian coordinate system using the datum indicated in the Datum field. The position is that of the marker. The ARP-to-marker offset is set through the command **setAntennaOffset**.

For highest accuracy, the receiver tries to compute the baseline (Base2RoverX, Base2RoverY, Base2RoverZ) from rover ARP to base ARP. See the description of the BaseVectorCart block for details.

Accurate ARP-to-ARP baseline is guaranteed only if both bits 0 and 1 of the Misc field are set. Otherwise, centimeter-level offsets may arise because the receiver cannot make the distinction between phase center and ARP positions. See section 2.5 for a discussion on the phase center and ARP positions.

This block also contains the variance-covariance information and DOP factors associated with the position.

Misc	u1		Bit field containing miscellaneous flags:
			Bit 0: In DGNSS or RTK mode, set if the baseline points to the base station ARP. Unset if it points to the antenna phase center, or if unknown. Bit 1: Set if the phase center offset is compensated for at the rover, unset if not or unknown.
			Bit 2: Proprietary.
			Bit 3: Proprietary.
			Bits 4-5: Proprietary.
			Bits 6-7: Flag indicating whether the marker position reported in this block is also the ARP position (i.e. whether the ARP-to-marker offset provided with the setAntennaOffset command is zero or not) 0: Unknown
			1: The ARP-to-marker offset is zero 2: The ARP-to-marker offset is not zero
Reserved	u1		Reserved for future use.
AlertFlag	u1	0	Bit field indicating integrity related information:
			Bits 0-1: RAIM integrity flag: 0: RAIM not active (integrity not monitored) 1: RAIM integrity test successful 2: RAIM integrity test failed 3: Reserved Bit 2: set if integrity has failed as per Galileo HPCA (HMI Probability Computation Algorithm) Bit 3: set if Galileo ionospheric storm flag is active
			Bit 4: Reserved
			Bits 5-7: Reserved
Datum	u1	255	This field defines in which datum the coordinates are expressed: 0: WGS84/ITRS 19: Datum equal to that used by the DGNSS/RTK base station 30: ETRS89 (ETRF2000 realization) 31: NAD83(2011), North American Datum (2011) 32: NAD83(PA11), North American Datum, Pacific plate (2011) 33: NAD83(MA11), North American Datum, Marianas plate (2011) 34: GDA94(2010), Geocentric Datum of Australia (2010) 35: GDA2020, Geocentric Datum of Australia 2020 36: JGD2011, Japanese Geodetic Datum 2011 250: First user-defined datum 251: Second user-defined datum
NrSV	u1	255	Total number of satellites used in the PVT computation.
WACorrInfo	u1	0	Bit field providing information about which corrections have been applied: Bit 0: set if orbit and satellite clock correction information is used
			Bit 1: set if range correction information is used
			Bit 2: set if ionospheric information is used
			Bit 3: set if orbit accuracy information is used (UERE/SISA)
			Bit 4: set if DO229 Precision Approach mode is active
			Bits 5-6: Type of RTK or DGNSS differential corrections:
			0: unknown or not in differential positioning mode (DGNSS or RTK) 1: corrections from a physical base 2: corrections from a virtual base (VRS) 3: SSR corrections (RTK using SSR corrections is often referred to as RTK-SSR or PPP-RTK) Bit 7: Reserved
ReferenceId	u2	65535	This field indicates the reference ID of the differential information used. In case of DGNSS or RTK operation, this field is to be interpreted as the base station identifier. In SBAS operation, this field is to be interpreted as the PRN of the geostationary satellite used (from 120 to 158). If multiple base stations or multiple geostationary satellites are used the value is set to 65534.

MeanCorrAge	u2	0.01 s	In case of DGNSS or RTK, this field is the mean age of the differential corrections. In case of SBAS operation, this field is the mean age of the 'fast corrections' provided by the SBAS satellites. In case of PPP, this is the age of the last received clock or orbit correction message.
SignalInfo	u4		Bit field indicating the type of GNSS signals having been used in the PVT computations. If a bit i is set, the signal type having index i has been used. The signal numbers are listed in section 4.1.10. Bit 0 (GPS-C/A) is the LSB of SignalInfo.
Padding	u1[]		Padding bytes, see 4.1.5

PosLocal	Number:	4052
	"OnChange"	interval: default PVT output rate (see 4.1.8)

This block contains the position at the time specified in the TOW and WNC fields. The time of applicability is specified in the receiver time frame.

The position (Lat, Lon, Alt) relates to the local datum identified with the <code>Datum</code> field. The coordinate transformation to the local datum is done using parameters transmitted by the RTK service provider in RTCM message types MT1021 to MT1023.

The position is that of the marker. The ARP-to-marker offset is set through the command **setAntennaOffset**.

If no position is available, the Error field indicates the cause of the unavailability and all fields after the Error field are set to their respective Do-Not-Use values.

To be able to output a position in the PosLocal block, the receiver needs to have received the relevant RTCM transformation messages (at least either MT1021 or MT1022 is required). If they have not been received yet, the local position is not available and the Error field is set to value 17. See also section 2.4.6.

The corresponding RTCMDatum block provides information on the local datum name and transformation quality indicators. The corresponding RTCMDatum block is the one of which the Datum field matches the Datum field in the Poslocal block.

Mode	u1			Bit field indicating the GNSS PVT mode, as follows:
				Bits 0-3: type of PVT solution:
				0: No GNSS PVT available (the Error field indicates the cause of the absence of the PVT solution) 1: Stand-Alone PVT 2: Differential PVT 3: Fixed location 4: RTK with fixed ambiguities 5: RTK with float ambiguities 6: SBAS aided PVT 7: moving-base RTK with fixed ambiguities 8: moving-base RTK with float ambiguities 9: Reserved 10: Precise Point Positioning (PPP) 12: Reserved Bits 4-5: Reserved Bit 6: Set if the user has entered the command setPVTMode, Static,, auto and the receiver is still in the process of determining its fixed position. Bit 7: 2D/3D flag: set in 2D mode (height assumed constant and not computed).
Error	u1			PVT error code. The following values are defined: 0: No Error 1: Not enough measurements 2: Not enough ephemerides available 3: DOP too large (larger than 15) 4: Sum of squared residuals too large 5: No convergence 6: Not enough measurements after outlier rejection 7: Position output prohibited due to export laws 8: Not enough differential corrections available 9: Base station coordinates unavailable 10: Ambiguities not fixed and user requested to only output RTK-fixed positions 17: Datum transformation parameters unknown
Lat	f8	1 rad	-2·10 ¹⁰	Latitude, from $-\pi/2$ to $+\pi/2$, positive North of Equator
Lon	f8	1 rad	-2·10 ¹⁰	Longitude, from $-\pi$ to $+\pi$, positive East of Greenwich
Alt	f8	1 m	-2·10 ¹⁰	Height. See the HeightType field of the corresponding RTCMDatum block for the interpretation of the height.
Datum	u1			Reference frame to which the position relate. If the value is in the 20 to 24 range, the corresponding datum parameters can be found in the RTCMDatum block having a matching Datum field. Value 25 corresponds to the local coordinate reference system selected with the setLocalCoordOperation command.
Padding	u1[]			Padding bytes, see 4.1.5

PosProjected	Number:	4094
	"OnChange"	interval: default PVT output rate (see 4.1.8)

This block contains the projected coordinates at the time specified in the TOW and WNC fields. The time of applicability is specified in the receiver time frame.

The coordinates (Northing, Easting, Alt) relate to the local datum identified with the <code>Datum</code> field. The coordinate transformation and projection is done using parameters transmitted by the RTK service provider in RTCM message types MT1021 to MT1027.

The position is that of the marker. The ARP-to-marker offset is set through the command **setAntennaOffset**.

If no position is available, the Error field indicates the cause of the unavailability and all fields after the Error field are set to their respective Do-Not-Use values.

To be able to output a position in the PosProjected block, the receiver needs to have received at least one RTCM message in the MT1025 to MT1027 range. If none of these messages is sent out by the service provider, or if they have not been received yet, the projected position is not available and the Error field is set to value 17. See also section 2.4.6.

The corresponding RTCMDatum block provides information on the local datum name and transformation/projection quality indicators. The corresponding RTCMDatum block is the one of which the Datum field matches the Datum field in the PosProjected block.

Datum	u1			Reference frame to which the position relate. If the value is in the 20 to 24 range, the corresponding datum parameters can be found in the RTCMDatum block having a matching Datum field. Value 25 corresponds to the local coordinate reference system selected with the setLocalCoordOperation command.
Padding	u1[]			Padding bytes, see 4.1.5

BaseVectorCart	Number:	4043
	"OnChange"	interval: default PVT output rate (see 4.1.8)

The BaseVectorCart block contains the relative position and orientation of one or more base stations, as seen from the rover (i.e. this receiver). The relative position is expressed in the Cartesian X, Y, Z directions.

For highest accuracy, the receiver tries to compute the baseline from rover antenna reference point (ARP) to base ARP. This requires to compensate for the phase center offset at both the base and the rover antennas. This is possible if two conditions are met:

- the base station must transmit its antenna parameters in RTCM2 message types 23 and 24 or in RTCM3 message types 1005/1006 and 1007/1008. Older RTCM2 messages and CMR do not allow phase center offset compensation.
- the base and rover antenna types must belong to the list returned by the command lstAntennaInfo, overview. (see the description of the commands setAntennaOffset and lstAntennaInfo for details).

Accurate ARP-to-ARP baseline is guaranteed only if both bits 0 and 1 of the Misc field are set. Otherwise, centimeter-level offsets may arise because the receiver cannot make the distinction between phase center and ARP positions. See section 2.5 for a discussion on the phase center and ARP positions.

The block supports multi-base operation. It contains as many sub-blocks as available base stations, each sub-block containing the baseline relative to a single base station identified by the ReferenceID field.

BaseVectorGeod	Number:	4028
	"OnChange"	interval: default PVT output rate (see 4.1.8)

The <code>BaseVectorGeod</code> block contains the relative position and orientation of one or more base stations, as seen from the rover (i.e. this receiver). The relative position is expressed in the <code>East-North-Up</code> directions.

For highest accuracy, the receiver tries to compute the baseline from rover antenna reference point (ARP) to base ARP. See the description of the BaseVectorCart block for details.

Accurate ARP-to-ARP baseline is guaranteed only if both bits 0 and 1 of the Misc field are set. Otherwise, centimeter-level offsets may arise because the receiver cannot make the distinction between phase center and ARP positions. See section 2.5 for a discussion on the phase center and ARP positions.

The block supports multi-base operation. It contains as many sub-blocks as available base stations, each sub-block containing the baseline coordinates relative to a single base station identified by the ReferenceID field.

VectorInfoGeod sub-block definition:

Parameter	Туре	Units	Do-Not-Use	Description
NrSV	u1			Number of satellites for which the PVT engine used corrections from the base station identified by the ReferenceID field.
Error	u1			PVT error code. The following values are defined: 0: No Error 1: Not enough measurements 2: Not enough ephemerides available 3: DOP too large (larger than 15) 4: Sum of squared residuals too large 5: No convergence 6: Not enough measurements after outlier rejection 7: Position output prohibited due to export laws 8: Not enough differential corrections available 9: Base station coordinates unavailable 10: Ambiguities not fixed and user requested to only output RTK-fixed positions

Mode	u1			Bit field indicating the GNSS PVT mode, as follows:
				Bits 0-3: type of PVT solution:
				0: No GNSS PVT available (the Error field indicates the cause of the absence of the PVT solution) 1: Stand-Alone PVT 2: Differential PVT 3: Fixed location 4: RTK with fixed ambiguities 5: RTK with float ambiguities 6: SBAS aided PVT 7: moving-base RTK with fixed ambiguities 8: moving-base RTK with float ambiguities 9: Reserved 10: Precise Point Positioning (PPP) 12: Reserved Bits 4-5: Reserved
				Bit 6: Set if the user has entered the command setPVTMode, Static, , auto and the receiver is still in the process of determining its fixed position. Bit 7: 2D/3D flag: set in 2D mode (height assumed constant and
Misc	u1			not computed). Bit field containing miscellaneous flags:
				Bit 0: Set if the baseline points to the base station ARP. Unset if it points to the antenna phase center, or if unknown. Bit 1: Set if the phase center offset is compensated for at the rover (i.e. the baseline starts from the antenna ARP), unset if not or unknown. Bit 2: Proprietary.
				Bit 3: Proprietary.
				Bits 4-5: Proprietary.
				Bits 6-7: Reserved
DeltaEast	f8	1 m	-2·10 ¹⁰	East baseline component (from rover to base)
DeltaNorth	f8	1 m	-2·10 ¹⁰	North baseline component (from rover to base)
DeltaUp	f8	1 m	-2·10 ¹⁰	Up baseline component (from rover to base)
DeltaVe	f4	1 m / s	-2·10 ¹⁰	East velocity of base with respect to rover
DeltaVn	f4	1 m / s	$-2 \cdot 10^{10}$	North velocity of base with respect to rover
DeltaVu	f4	1 m / s	-2·10 ¹⁰	Up velocity of base with respect to rover
Azimuth	u2	0.01 degrees	65535	Azimuth of the base station (from 0 to 360° , increasing towards east)
Elevation	i2	0.01 degrees	-32768	Elevation of the base station (from -90° to 90°)
ReferenceID	u2			Base station ID
CorrAge	u2	0.01 s	65535	Age of the oldest differential correction used for this baseline computation.
SignalInfo	u4		0	Bit field indicating the GNSS signals for which differential corrections are available from the base station identified by ReferenceID. If bit <i>i</i> is set, corrections for the signal type having index <i>i</i> are available. The signal numbers are listed in section 4.1.10. Bit 0 (GPS-C/A) is the LSB of SignalInfo.
Padding	u1[]			Padding bytes, see 4.1.5

PVTSupport Number	r: 4076	
"OnCha	ange" interval: default PVT output rate (see 4.1.8)	

This block contains various internal parameters that can be used for maintenance and support.

The detailed definition of this block is not available in this document.

PVTSupportA	Number:	4079
	"OnChange"	interval: default PVT output rate (see 4.1.8)

This block contains various internal parameters that can be used for maintenance and support.

The detailed definition of this block is not available in this document.

EndOfPVT	Number:	5921
	"OnChange"	interval: default PVT output rate (see 4.1.8)

This block marks the end of transmission of all PVT related blocks belonging to the same epoch.

Parameter	Туре	Units	Do-Not-Use	Description

4.2.11 GNSS Attitude Blocks

AttEuler	Number:	5938
	"OnChange"	interval: default PVT output rate (see 4.1.8)

The AttEuler block contains the Euler angles (pitch, roll and heading) at the time specified in the TOW and WNc fields (in the receiver time frame).

Parameter	Туре	Units	Do-Not-Use	Description
Sync1	c1			
Sync2	c1			
CRC	u2			Block Header, see 4.1.1
ID	u2			
Length	u2	1 byte		
TOW	u4	0.001 s	4294967295	Receiver time stamp, see 4.1.3
WNc	u2	1 week	65535	Receiver time stamp, see 4.1.5
NrSV	u1		255	The average over all antennas of the number of satellites currently included in the attitude calculations.
Error	u1			Bit field providing error information. For each antenna baseline, two bits are used to provide error information: Bits 0-1: Error code for Main-Aux1 baseline:
				0: No error 1: Not enough measurements 2: Reserved 3: Reserved Bits 2-3: Error code for Main-Aux2 baseline, same definition as bit 0- 1. Bits 4-6: Reserved
				Bit 7: Set when GNSS-based attitude not requested by user. In that case, the other bits are all zero.
Mode	u2			 Attitude mode code: 0: No attitude 1: Heading, pitch (roll = 0), aux antenna positions obtained with float ambiguities 2: Heading, pitch (roll = 0), aux antenna positions obtained with fixed ambiguities 3: Heading, pitch, roll, aux antenna positions obtained with float ambiguities 4: Heading, pitch, roll, aux antenna positions obtained with fixed ambiguities
Reserved	u2			Reserved for future use, to be ignored by decoding software
Heading	f4	1 degree	-2·10 ¹⁰	Heading
Pitch	f4	1 degree	-2·10 ¹⁰	Pitch
Roll	f4	1 degree	-2·10 ¹⁰	Roll
PitchDot	f4	1 degree / s	-2·10 ¹⁰	Rate of change of the pitch angle
RollDot	f4	1 degree / s		Rate of change of the roll angle
HeadingDot	f4	1 degree / s		Rate of change of the heading angle
Padding	u1[]	-		Padding bytes, see 4.1.5

AttCovEuler	Number:	5939
	"OnChange"	interval: default PVT output rate (see 4.1.8)

This block contains the elements of the symmetric variance-covariance matrix of the attitude angles reported in the AttEuler block

$$egin{pmatrix} \sigma_{\phi}^2 & \sigma_{\phi heta} & \sigma_{\phi \psi} \ \sigma_{ heta \phi} & \sigma_{ heta}^2 & \sigma_{ heta \psi} \ \sigma_{\psi \phi} & \sigma_{\psi heta} & \sigma_{\psi}^2 \end{pmatrix}$$

This variance-covariance matrix contains an indication of the accuracy of the estimated parameters (see diagonal elements) and the correlation between these estimates (see off-diagonal elements).

In case the receiver is in heading and pitch mode only, only the heading and pitch variance values will be valid. All other components of the variance-covariance matrix are set to their Do-Not-Use value.

4.2.12 Receiver Time Blocks

ReceiverTime	Number:		5914		
	"OnChange"	interval:	:1s		

The ReceiverTime block provides the current time with a 1-second resolution in the receiver time scale and UTC.

The level of synchronization of the receiver time with the satellite system time is provided in the SyncLevel field.

UTC time is provided if the UTC parameters have been received from at least one GNSS satellite. If the UTC time is not available, the corresponding fields are set to their Do-Not-Use value.

Parameter	Туре	Units	Do-Not-Use	Description	
Sync1	c1				
Sync2	c1				
CRC	u2			Block Header, see 4.1.1	
ID	u2				
Length	u2	1 byte			
TOW	u4	0.001 s	4294967295	Receiver time stamp, see 4.1.3	
WNc	u2	1 week	65535		
UTCYear	i1	1 year	-128	Current year in the UTC time scale (2 digits). From 0 to 99, or -128 if not available	
UTCMonth	i1	1 month	-128	Current month in the UTC time scale. From 1 to 12, or -128 if not available	
UTCDay	i1	1 day	-128	Current day in the UTC time scale. From 1 to 31, or -128 if not available	
UTCHour	i1	1 hour	-128	Current hour in the UTC time scale. From 0 to 23, or -128 if not available	
UTCMin	i1	1 minute	-128	Current minute in the UTC time scale. From 0 to 59, or -128 if not available	
UTCSec	i1	1 s	-128	Current second in the UTC time scale. From 0 to 59, or -128 if not available	
DeltaLS	i1	1 s	-128	Integer second difference between UTC time and GPS system time. Positive if GPS time is ahead of UTC. Set to -128 if not available.	
SyncLevel	u1			Bit field indicating the synchronization level of the receiver time. If bits 0 to 2 are set, full synchronization is achieved:	
				Bit 0: WNSET: if this bit is set, the receiver week number is set.	
				Bit 1: TOWSET: if this bit is set, the receiver time-of-week is set to within 20ms. Bit 2: FINETIME: if this bit is set, the receiver time-of-week is within the limit specified by the setClockSyncThreshold command. Bit 3: Reserved	
				Bit 4: Reserved	
				Bits 5-7: Reserved	
Padding	u1[]			Padding bytes, see 4.1.5	

xPPSOffset	Number:	5911	
	"OnChange"	interval: PPS rate	

The xPPSOffset block contains the offset between the true xPPS pulse and the actual pulse output by the receiver. It is output right after each xPPS pulse.

On receivers with more than one independent PPS outputs, this block always refers to the first PPS output.

Parameter	Туре	Units	Do-Not-Use	Description
Sync1	c1			
Sync2	c1			
CRC	u2			Block Header, see 4.1.1
ID	u2			
Length	u2	1 byte		
TOW	u4	0.001 s	4294967295	Receiver time stamp, see 4.1.3
WNc	u2	1 week	65535	Receiver time stamp, see 4.1.5
SyncAge	u1	1 s		Age of the last synchronization to system time. The xPPS pulse is regularly resynchronized with system time. This field indicates the number of seconds elapsed since the last resynchronization. SyncAge is constrained to the 0-255s range. If the age is higher than 255s, SyncAge is set to 255. If the PPS is synchronized with the internal receiver time (Timescale = 3), SyncAge is always set to 0.
TimeScale	u1			Time scale to which the xPPS pulse is referenced, as set with the setPPSParameters command: 1: GPS time 2: UTC time 3: Receiver time 4: GLONASS time 5: Galileo time 6: BeiDou time 100: Fugro AtomiChron time
Offset	f4	1 · 10 ^{−9} s		Offset of the xPPS output by the receiver with respect to its true position. Offset is negative when the xPPS pulse is in advance with respect to its true position. See also section 1.20 for an explanation of the xPPS generation principle, and for a description of the xPPS offset.
Padding	u1[]			Padding bytes, see 4.1.5

4.2.13 External Event Blocks

These blocks report the state of the receiver applicable at the instant of a level transition on one of its "Event" pins. The receiver time is reported in the <code>ExtEvent SBF</code> block, and the receiver position is reported in the <code>ExtEventPVTCartesian</code> and the <code>ExtEventPVTGeodetic</code> blocks.

If enabled, upon detection of an event, these three blocks are output in the following order, with no other SBF blocks in between them:

- 1. ExtEvent;
- 2. ExtEventPVTCartesian;
- 3. ExtEventPVTGeodetic.

All blocks referring to the same event contain the same time stamp in the TOW and WNc fields.

ExtEvent	Number:	5924
	"OnChange"	interval: each time an event is detected

The ${\tt ExtEvent}$ block contains the time tag of a voltage transition on one of the "Event" input pins.

Parameter	Type	Units	Do-Not-Use	Description
Sync1	с1			
Sync2	c1			
CRC	u2			Block Header, see 4.1.1
ID	u2			
Length	u2	1 byte		
TOW	u4	0.001 s	4294967295	External time stamp, see 4.1.3
WNc	u2	1 week	65535	External unite stamp, see 4.1.5
Source	u1			Input pin where this external event has been detected. The following values are defined: 1: EventA 2: EventB
Polarity	u1			0: rising edge event 1: falling edge event
Offset	f4	1 s		Event time offset with respect to TOW, including the potential delay specified with the $\mathtt{setEventParameters}$ command. The time of week of the external event is given by: $t_{\mathrm{ext,rx}} [s] = \mathtt{TOW/1000} + \mathtt{Offset}$ $t_{\mathrm{ext,rx}} \text{refers to the receiver system time scale. Use the } \mathtt{RxClkBias} \text{field}$ to convert this time to the GNSS time scale.
RxClkBias	f8	1 s	−2·10 ¹⁰	Receiver clock bias at the time of event. The clock bias is relative to the time system of the last PVT computation (see the <code>TimeSystem</code> field of the <code>PVTCartesian</code> or <code>PVTGeodetic</code> blocks). To get the time of week of the external event in GNSS time, use: $t_{\rm ext,GNSS} [s] = {\tt TOW/1000 + Offset - RxClkBias}.$ The accuracy of the clock bias is dependent on the age of the last PVT solution. When the receiver has been unable to compute a PVT during the last 10 minutes, this field is set to its Do-Not-Use value.
PVTAge	u2	1 s		Age of the last PVT solution. If the PVT age is larger than 10 minutes (600s), this value is clipped to 600.
Padding	u1[]			Padding bytes, see 4.1.5

Rev 1

ExtEventPVTCartesian	Number:	4037		
	"OnChange"	interval: each time	an external	event is
		detected		

This block contains the position and clock bias applicable at the time of an external event, in a Cartesian coordinate system.

This block has the same structure and description as the PVTCartesian block, except that the TOW and WNc fields refer to the time at which the electrical transition on the event pin has been detected (with a millisecond resolution), and that the position is computed at the event time, taking into account a possible user-defined delay set by the **setEventParameters** command.

A user needing the sub-millisecond part of the event time must refer to the Offset field of the corresponding ExtEvent block. The corresponding ExtEvent block is the last of the ExtEvent blocks having been output by the receiver.

Parameter	Туре	Units	Do-Not-Use	Description
Sync1	c1			
Sync2	c1			
CRC	u2			Block Header, see 4.1.1

Vz	f4	1 m / s	$-2 \cdot 10^{10}$	Not applicable
COG	f4	1 degree	-2·10 ¹⁰	Course over ground: this is defined as the angle of the vehicle with respect to the local level North, ranging from 0 to 360, and increasing towards east. Set to the Do-Not-Use value when the speed is lower than 0.1m/s.
RxClkBias	f8	1 ms	−2·10 ¹⁰	Receiver clock bias relative to the system time reported in the $\texttt{TimeSystem}$ field. Positive when the receiver time is ahead of the system time. To transfer the receiver time to the system time, use: $t_{sys} = t_{rx} - \texttt{RxClkBias}$
RxClkDrift	f4	1 ppm	$-2 \cdot 10^{10}$	Not applicable
TimeSystem	u1		255	Time system to which the offset is provided in this sub-block: 0: GPS time 1: Galileo time 3: GLONASS time 4: BeiDou time 5: QZSS time 100: Fugro AtomiChron time
Datum	u1		255	This field defines in which datum the coordinates are expressed: 0: WGS84/ITRS 19: Datum equal to that used by the DGNSS/RTK base station 30: ETRS89 (ETRF2000 realization) 31: NAD83(2011), North American Datum (2011) 32: NAD83(PA11), North American Datum, Pacific plate (2011) 33: NAD83(MA11), North American Datum, Marianas plate (2011) 34: GDA94(2010), Geocentric Datum of Australia (2010) 35: GDA2020, Geocentric Datum of Australia 2020 36: JGD2011, Japanese Geodetic Datum 2011 250: First user-defined datum 251: Second user-defined datum
NrSV	u1		255	Total number of satellites used in the PVT computation.
WACorrInfo	u1		0	Bit field providing information about which corrections have been applied: Bit 0: set if orbit and satellite clock correction information is used Bit 1: set if range correction information is used Bit 2: set if ionospheric information is used Bit 3: set if orbit accuracy information is used (UERE/SISA) Bit 4: set if DO229 Precision Approach mode is active Bits 5-6: Type of RTK or DGNSS differential corrections: 0: unknown or not in differential positioning mode (DGNSS or RTK) 1: corrections from a physical base 2: corrections from a virtual base (VRS) 3: SSR corrections (RTK using SSR corrections is often referred to as RTK-SSR or PPP-RTK) Bit 7: Reserved
ReferenceID	u2		65535	This field indicates the reference ID of the differential information used. In case of DGNSS or RTK operation, this field is to be interpreted as the base station identifier. In SBAS operation, this field is to be interpreted as the PRN of the geostationary satellite used (from 120 to 158). If multiple base stations or multiple geostationary satellites are used the value is set to 65534.

SignalInfo AlertFlag NrBases PPPInfo	u4 u1		0	Bit field indicating the type of GNSS signals having been used in the PV computations. If a bit <i>i</i> is set, the signal type having index <i>i</i> has been used. The signal numbers are listed in section 4.1.10. Bit 0 (GPS-C/A) if the LSB of SignalInfo. Bit field indicating integrity related information: Bits 0-1: RAIM integrity flag: 0: RAIM not active (integrity not monitored)
NrBases	u1		0	Bits 0-1: RAIM integrity flag: 0: RAIM not active (integrity not monitored)
				0: RAIM not active (integrity not monitored)
				1: RAIM integrity test successful 2: RAIM integrity test failed 3: Reserved Bit 2: set if integrity has failed as per Galileo HPCA (HMI Probabilit Computation Algorithm)
		1		Bit 3: set if Galileo ionospheric storm flag is active
				Bit 4: Reserved
	1			Bits 5-7: Reserved
PPPInfo	u1		0	Number of base stations used in the PVT computation.
	u2		0	Bit field containing PPP-related information:
		1 s		Bits 0-11: Age of the last seed, in seconds. The age is clipped to 4091: This field must be ignored when the seed type is 0 (see bit 13-15 below).
				Bit 12: Reserved
				Bits 13-15: Type of last seed:
				O: Not seeded or not in PPP positioning mode 1: Manual seed 2: Seeded from DGNSS 3: Seeded from RTKFixed
Latency	u2	0.0001 s	65535	Time elapsed between the time of applicability of the position fix and the generation of this SBF block by the receiver. This time includes the receiver processing time, but not the communication latency.
HAccuracy	u2	0.01 m	65535	2DRMS horizontal accuracy: twice the root-mean-square of the horizontal distance error. The horizontal distance between the true position and the computed position is expected to be lower that HACCURACY with a probability of at least 95%. The value is clipped to 65534 = 655.34m
VAccuracy	u2	0.01 m	65535	2-sigma vertical accuracy. The vertical distance between the true position and the computed position is expected to be lower that VAccuracy with a probability of at least 95%. The value is clipped to 65534 =655.34m.
Misc	u1			Bit field containing miscellaneous flags:
				Bit 0: In DGNSS or RTK mode, set if the baseline points to the bas station ARP. Unset if it points to the antenna phase cente or if unknown. Bit 1: Set if the phase center offset is compensated for at the rove unset if not or unknown. Bit 2: Proprietary. Bit 3: Proprietary. Bits 4-5: Proprietary. Bits 6-7: Flag indicating whether the marker position reported in thi block is also the ARP position (i.e. whether the ARP-to marker offset provided with the setAntennaOffset command is zero or not)
Padding	1			0: Unknown

Rev 1

Mode	u1			Bit field indicating the GNSS PVT mode, as follows:
				Bits 0-3: type of PVT solution:
				0: No GNSS PVT available (the Error field indicates the cause of the absence of the PVT solution) 1: Stand-Alone PVT 2: Differential PVT 3: Fixed location 4: RTK with fixed ambiguities 5: RTK with float ambiguities 6: SBAS aided PVT 7: moving-base RTK with fixed ambiguities 8: moving-base RTK with float ambiguities 9: Reserved 10: Precise Point Positioning (PPP) 12: Reserved Bits 4-5: Reserved Bit 6: Set if the user has entered the command setPVTMode, Static, , auto and the receiver is still in the process of determining its fixed position. Bit 7: 2D/3D flag: set in 2D mode (height assumed constant and not computed).
Error	u1			PVT error code. The following values are defined: 0: No Error 1: Not enough measurements 2: Not enough ephemerides available 3: DOP too large (larger than 15) 4: Sum of squared residuals too large 5: No convergence 6: Not enough measurements after outlier rejection 7: Position output prohibited due to export laws 8: Not enough differential corrections available 9: Base station coordinates unavailable 10: Ambiguities not fixed and user requested to only output RTK-fixed positions

Latitude	f8	1 rad	$-2 \cdot 10^{10}$	Latitude, from $-\pi/2$ to $+\pi/2$, positive North of Equator
Longitude	f8	1 rad	$-2 \cdot 10^{10}$	Longitude, from $-\pi$ to $+\pi$, positive East of Greenwich
Height	f8	1 m	$-2 \cdot 10^{10}$	Ellipsoidal height (with respect to the ellipsoid specified by Datum)
Undulation	f4	1 m	-2·10 ¹⁰	Geoid undulation. See the setGeoidUndulation command.
Vn	f4	1 m / s	$-2 \cdot 10^{10}$	Not applicable
Ve	f4	1 m / s	$-2 \cdot 10^{10}$	Not applicable
Vu	f4	1 m / s	$-2 \cdot 10^{10}$	Not applicable
COG	f4	1 degree	-2·10 ¹⁰	Course over ground: this is defined as the angle of the vehicle with respect to the local level North, ranging from 0 to 360, and increasing towards east. Set to the Do-Not-Use value when the speed is lower than 0.1m/s.
RxClkBias	f8	1 ms	-2·10 ¹⁰	Receiver clock bias relative to the system time reported in the $\texttt{TimeSystem}$ field. Positive when the receiver time is ahead of the system time. To transfer the receiver time to the system time, use: $t_{sys} = t_{rx} - \texttt{RxClkBias}$
RxClkDrift	f4	1 ppm	$-2 \cdot 10^{10}$	Not applicable
TimeSystem	u1		255	Time system to which the offset is provided in this sub-block: 0: GPS time 1: Galileo time 3: GLONASS time 4: BeiDou time 5: QZSS time 100: Fugro AtomiChron time
Datum	u1		255	This field defines in which datum the coordinates are expressed: 0: WGS84/ITRS 19: Datum equal to that used by the DGNSS/RTK base station 30: ETRS89 (ETRF2000 realization) 31: NAD83(2011), North American Datum (2011) 32: NAD83(PA11), North American Datum, Pacific plate (2011) 33: NAD83(MA11), North American Datum, Marianas plate (2011) 34: GDA94(2010), Geocentric Datum of Australia (2010) 35: GDA2020, Geocentric Datum of Australia 2020 36: JGD2011, Japanese Geodetic Datum 2011 250: First user-defined datum 251: Second user-defined datum
NrSV	u1		255	Total number of satellites used in the PVT computation.
WACorrInfo	u1		0	Bit field providing information about which corrections have been applied: Bit 0: set if orbit and satellite clock correction information is used Bit 1: set if range correction information is used Bit 2: set if ionospheric information is used Bit 3: set if orbit accuracy information is used (UERE/SISA) Bit 4: set if DO229 Precision Approach mode is active Bits 5-6: Type of RTK or DGNSS differential corrections: 0: unknown or not in differential positioning mode (DGNSS or RTK) 1: corrections from a physical base 2: corrections from a virtual base (VRS) 3: SSR corrections (RTK using SSR corrections is often referred to as RTK-SSR or PPP-RTK) Bit 7: Reserved
ReferenceID	u2		65535	This field indicates the reference ID of the differential information used. In case of DGNSS or RTK operation, this field is to be interpreted as the base station identifier. In SBAS operation, this field is to be interpreted as the PRN of the geostationary satellite used (from 120 to 158). If multiple base stations or multiple geostationary satellites are used the value is set to 65534.

MeanCorrAge	u2	0.01 s	65535	In case of DGNSS or RTK, this field is the mean age of the differentia corrections. In case of SBAS operation, this field is the mean age of the 'fast corrections' provided by the SBAS satellites. In case of PPP, this is the age of the last received clock or orbit correction message.
SignalInfo	u4		0	Bit field indicating the type of GNSS signals having been used in the PVI computations. If a bit i is set, the signal type having index i has been used. The signal numbers are listed in section 4.1.10. Bit 0 (GPS-C/A) is the LSB of SignalInfo.
AlertFlag	u1		0	Bit field indicating integrity related information:
				Bits 0-1: RAIM integrity flag: 0: RAIM not active (integrity not monitored) 1: RAIM integrity test successful 2: RAIM integrity test failed 3: Reserved Bit 2: set if integrity has failed as per Galileo HPCA (HMI Probability)
				Computation Algorithm)
				Bit 3: set if Galileo ionospheric storm flag is active Bit 4: Reserved
				Bits 5-7: Reserved
NrBases	u1		0	Number of base stations used in the PVT computation.
PPPInfo	u2		0	Bit field containing PPP-related information:
		1 s		Bits 0-11: Age of the last seed, in seconds. The age is clipped to 4091s This field must be ignored when the seed type is 0 (see bit 13-15 below).
				Bit 12: Reserved Bits 13-15: Type of last seed:
				O: Not seeded or not in PPP positioning mode 1: Manual seed 2: Seeded from DGNSS 3: Seeded from RTKFixed
Latency	u2	0.0001 s	65535	Time elapsed between the time of applicability of the position fix and the generation of this SBF block by the receiver. This time includes the receiver processing time, but not the communication latency.
HAccuracy	u2	0.01 m	65535	2DRMS horizontal accuracy: twice the root-mean-square of the hor izontal distance error. The horizontal distance between the true position and the computed position is expected to be lower than Haccuracy with a probability of at least 95%. The value is clipped to 65534 = 655.34m
VAccuracy	u2	0.01 m	65535	2-sigma vertical accuracy. The vertical distance between the true position and the computed position is expected to be lower than VAccuracy with a probability of at least 95%. The value is clipped to 65534 =655.34m.
Misc	u1			Bit field containing miscellaneous flags:
				Bit 0: In DGNSS or RTK mode, set if the baseline points to the base station ARP. Unset if it points to the antenna phase center or if unknown. Bit 1: Set if the phase center offset is compensated for at the rover unset if not or unknown. Bit 2: Proprietary.
				Bit 3: Proprietary.
				Bits 4-5: Proprietary. Bits 6-7: Flag indicating whether the marker position reported in thi block is also the ARP position (i.e. whether the ARP-to marker offset provided with the setAntennaOffset command is zero or not) 0: Unknown 1: The ARP-to-marker offset is zero 2: The ARP-to-marker offset is not zero
5 11'	45 -			Dadding house and 4.5
Padding	u1[]			Padding bytes, see 4.1.5

ExtEventBaseVectGeod N	lumber:	4217			
l III	OnChange"	interval: each	_	external	event is

This block contains the relative position and orientation of one or more base stations at the time of an external event. The relative position is expressed in the East-North-Up directions.

This block has the same structure and description as the <code>BaseVectorGeod</code> block, except that the <code>TOW</code> and <code>WNc</code> fields refer to the time at which the electrical transition on the event pin has been detected (with a millisecond resolution), and that the position is computed at the event time, taking into account a possible user-defined delay set by the <code>setEventParameters</code> command.

A user needing the sub-millisecond part of the event time must refer to the Offset field of the corresponding <code>ExtEvent</code> block. The corresponding <code>ExtEvent</code> block is the last of the <code>ExtEvent</code> blocks having been output by the receiver.

Parameter	Туре	Units	Do-Not-Use	Description
Sync1	c1			
Sync2	c1			
CRC	u2			Block Header, see 4.1.1
ID	u2			
Length	u2	1 byte		
TOW	u4	0.001 s	4294967295	External time stamp, see 4.1.3
WNc	u2	1 week	65535	External time stamp, see 4.1.5
N	u1			Number of baselines for which relative position, velocity and direction are provided in this SBF block, i.e. number of <code>ExtEventVectorInfoGeod</code> sub-blocks. If N is 0, there are no baseline available for this epoch.
SBLength	u1	1 byte		Length of one sub-block
ExtEventVectorInfoGeod				A succession of N ExtEventVectorInfoGeod sub-blocks, see definition below
Padding	u1[]			Padding bytes, see 4.1.5

ExtEventVectorInfoGeod sub-block definition:

Parameter	Туре	Units	Do-Not-Use	Description
NrsV	u1			Number of satellites for which the PVT engine used corrections from the base station identified by the ReferenceID field.
Error	u1			PVT error code. The following values are defined: 0: No Error 1: Not enough measurements 2: Not enough ephemerides available 3: DOP too large (larger than 15) 4: Sum of squared residuals too large 5: No convergence 6: Not enough measurements after outlier rejection 7: Position output prohibited due to export laws 8: Not enough differential corrections available 9: Base station coordinates unavailable 10: Ambiguities not fixed and user requested to only output RTK-fixed positions
Mode	u1			Bit field indicating the GNSS PVT mode, as follows:
				Bits 0-3: type of PVT solution:
				0: No GNSS PVT available (the Error field indicates the cause of the absence of the PVT solution) 1: Stand-Alone PVT 2: Differential PVT 3: Fixed location 4: RTK with fixed ambiguities 5: RTK with float ambiguities 6: SBAS aided PVT 7: moving-base RTK with fixed ambiguities 8: moving-base RTK with float ambiguities 9: Reserved 10: Precise Point Positioning (PPP) 12: Reserved Bits 4-5: Reserved Bit 6: Set if the user has entered the command setPVTMode, Static, , auto and the receiver is still in the process of determining its fixed position.
				Bit 7: 2D/3D flag: set in 2D mode (height assumed constant and not computed).
Misc	u1			Bit field containing miscellaneous flags: Bit 0: Set if the baseline points to the base station ARP. Unset if it points to the antenna phase center, or if unknown.
				Bit 1: Set if the phase center offset is compensated for at the rover (i.e. the baseline starts from the antenna ARP), unset if not or unknown. Bit 2: Proprietary. Bit 3: Proprietary. Bits 4-5: Proprietary. Bits 6-7: Reserved
DeltaEast	f8	1 m	-2·10 ¹⁰	East baseline component (from rover to base)
DeltaNorth	f8	1 m	-2·10 ¹⁰	North baseline component (from rover to base)
DeltaUp	f8	1 m	-2·10 ¹⁰	Up baseline component (from rover to base)
DeltaVe	f4	1 m / s	-2·10 ¹⁰	East velocity of base with respect to rover
DeltaVn	f4	1 m / s	-2·10 ¹⁰	North velocity of base with respect to rover
DeltaVu	f4	1 m / s	-2·10 ¹⁰	Up velocity of base with respect to rover
Azimuth	u2	0.01 degrees	65535	Azimuth of the base station (from 0 to 360°, increasing towards east)
Elevation	i2	0.01 degrees	-32768	Elevation of the base station (from -90 $^{\circ}$ to 90 $^{\circ}$)
ReferenceID	u2			Base station ID

CorrAge	u2	0.01 s	65535	Age of the oldest differential correction used for this baseline computation.
SignalInfo	u4		0	Bit field indicating the GNSS signals for which differential corrections are available from the base station identified by ReferenceID. If bit <i>i</i> is set, corrections for the signal type having index <i>i</i> are available. The signal numbers are listed in section 4.1.10. Bit 0 (GPS-C/A) is the LSB of SignalInfo.
Padding	u1[]			Padding bytes, see 4.1.5

ExtEventAttEuler	Number:	4237
	"OnChange"	interval: each time an external event is detected

This block contains the Euler angles (pitch, roll and heading) applicable at the time of an external event.

This block has the same structure and description as the AttEuler block, except that the TOW and WNc fields refer to the time at which the electrical transition on the event pin has been detected (with a millisecond resolution), and that the position is computed at the event time, taking into account a possible user-defined delay set by the **setEventParameters** command.

A user needing the sub-millisecond part of the event time must refer to the Offset field of the corresponding ExtEvent block. The corresponding ExtEvent block is the last of the ExtEvent blocks having been output by the receiver.

Parameter	Туре	Units	Do-Not-Use	Description
Sync1	c1			
Sync2	c1			
CRC	u2			Block Header, see 4.1.1
ID	u2			
Length	u2	1 byte		
TOW	u4	0.001 s	4294967295	External time stamp, see 4.1.3
WNc	u2	1 week	65535	External time stamp, see 4.1.3
NrSV	u1		255	The average over all antennas of the number of satellites currently included in the attitude calculations.
Error	u1			Bit field providing error information. For each antenna baseline, two bits are used to provide error information: Bits 0-1: Error code for Main-Aux1 baseline:
				0: No error 1: Not enough measurements 2: Reserved 3: Reserved Bits 2-3: Error code for Main-Aux2 baseline, same definition as bit 0- 1. Bits 4-6: Reserved
				Bit 7: Set when GNSS-based attitude not requested by user. In that case, the other bits are all zero.
Mode	u2			 Attitude mode code: 0: No attitude 1: Heading, pitch (roll = 0), aux antenna positions obtained with float ambiguities 2: Heading, pitch (roll = 0), aux antenna positions obtained with fixed ambiguities 3: Heading, pitch, roll, aux antenna positions obtained with float ambiguities 4: Heading, pitch, roll, aux antenna positions obtained with fixed ambiguities
Reserved	u2			Reserved for future use, to be ignored by decoding software
Heading	f4	1 degree	-2·10 ¹⁰	Heading
Pitch	f4	1 degree	-2·10 ¹⁰	Pitch
Roll	f4	1 degree	-2·10 ¹⁰	Roll
PitchDot	f4	1 degree / s	-2·10 ¹⁰	Not applicable
RollDot	f4	1 degree / s		Not applicable
HeadingDot	f4	1 degree / s		Not applicable
Padding	u1[]			Padding bytes, see 4.1.5

4.2.14 Correction Blocks

DiffCorrIn	Number:	5919
	"OnChange"	interval: each time a RTCM or CMR message is received

The DiffCorrIn block contains incoming RTCM or CMR messages. The length of the block depends on the message type and contents.

Parameter	Туре	Units	Do-Not-Use	Description
Sync1	c1			
Sync2	c1			
CRC	u2			Block Header, see 4.1.1
ID	u2			
Length	u2	1 byte		
TOW	u4	0.001 s	4294967295	Descriver time stamp, see 4.1.2
WNc	u2	1 week	65535	Receiver time stamp, see 4.1.3
Mode	u1			0: RTCMv2 1: CMRv2 2: RTCMv3 3: RTCMV (a proprietary variant of RTCM2) 4: SPARTN 5: Reserved
Source	u1		255	Indicates the receiver connection from which the message has been received: 0: COM1 1: COM2 2: COM3 3: COM4 4: USB1 5: USB2 6: IP connection 7: SBF file 8: L-Band (message decoded by the built-in L-band demodulator) 9: NTRIP 10: OTG1 11: OTG2 12: Bluetooth 15: UHF modem 16: IPR connection 17: Direct call port 18: IPS connection 19: SSR2OBS (message generated internally by SSR2OBS conversion)
If the Mode field is	0 then this u4[<i>N</i>]	field is	available:	30-bit words of the RTCM2 message. The Data Word Length (number of 32 bit words) is variable and depends on the RTCM2 message contents. It can be computed by the following piece of C code:
				N = 2 + ((RTCM2Words[1]»9) & $0x1f$); N can range from 2 to 33. The first two words are the RTCM2 message header and they are always present.
				Each of the words is organized as follows: Bits 0-5: 6 parity bits. They are provided for the sake of completeness. Parity doesn't need to be checked, since the DiffCorrIn block only contains valid words. Bits 6-29: 24 information-containing bits of the word. The first received bit is the MSB. Bits 30-31: bit 0 and 1 of the preceding word
		•	1	-
If the Mode field is	1 then this	field is	available:	
CMRMessage	u1[N]			N depends on the CMR message type.
<u> </u>			1	:

If the Mode field is 2 then this field is available:						
RTCM3Message	u1[N]	N depends on the RTCM 3 message type.				
If the Mode field is 3	then this field	available:				
RTCMVMessage	u1[<i>N</i>]	N depends on the RTCMV message type.				
Padding	u1[]	Padding bytes, see 4.1.5				

BaseStation	Number:	5949
	"OnChange"	interval: block generated each time a differential correc-
		tion message related to the base station coordi-
		nates is received

The BaseStation block contains the ECEF coordinates of the base station the receiver is currently connected to. This block helps users accessing the base station coordinates via SBF instead of having to decode the specific differential correction message (see the DiffCorrIn SBF block above).

The interpretation to give to the X, Y, Z ECEF coordinates is dependent on the value of the Source field:

Value of Source	Interpretation of X, Y, Z
0, 4 or 10	Coordinate of the L1 phase center
2 or 8	Antenna reference point
9	Proprietary

Parameter	Туре	Units	Do-Not-Use	Description	
Sync1	c1				
Sync2	c1				
CRC	u2			Block Header, see 4.1.1	
ID	u2				
Length	u2	1 byte			
TOW	u4	0.001 s	4294967295	Receiver time stamp, see 4.1.3	
WNc	u2	1 week	65535	receiver time stamp, see 4.1.5	
BaseStationID	u2			The base station ID	
BaseType	u1			Base station type: 0: Fixed 1: Moving (reserved for future use) 255: Unknown	
Source	u1			Source of the base station coordinates: 0: RTCM 2.x (Msg 3) 2: RTCM 2.x (Msg 24) 4: CMR 2.x (Msg 1) 8: RTCM 3.x (Msg 1005 or 1006) 9: RTCMV (Msg 3) 10: CMR+ (Type 2)	
Datum	u1		255	This field defines in which datum the coordinates are expressed: 0: WGS84/ITRS 19: Datum equal to that used by the DGNSS/RTK base station 30: ETRS89 (ETRF2000 realization) 31: NAD83(2011), North American Datum (2011) 32: NAD83(PA11), North American Datum, Pacific plate (2011) 33: NAD83(MA11), North American Datum, Marianas plate (2011) 34: GDA94(2010), Geocentric Datum of Australia (2010) 35: GDA2020, Geocentric Datum of Australia 2020 36: JGD2011, Japanese Geodetic Datum 2011 250: First user-defined datum 251: Second user-defined datum	
Reserved	u1			Reserved for future use, to be ignored by decoding software	
Х	f8	1 m		Antenna X coordinate expressed in the datum specified by the <code>Datum</code> field	
Y	f8	1 m		Antenna Y coordinate	
Z	f8	1 m		Antenna Z coordinate	
Padding	u1[]			Padding bytes, see 4.1.5	

RTCMDatum	Number:	4049				
	"OnChange"	interval: block generated each time a set of transformation				
	parameters is received					

This block reports the source and target datum names as transmitted in RTCM 3.x message types 1021 or 1022. It also reports the corresponding height and quality indicators.

If a service provider only sends out message types 1021 or 1022, this block is transmitted immediately after reception of MT1021 or MT1022. If message types 1023 or 1024 are also sent out, this block is transmitted after the reception of these messages and the QualityInd field is set accordingly.

Parameter	Туре	Units	Do-Not-Use	Description
Sync1	c1			
Sync2	c1			
CRC	u2			Block Header, see 4.1.1
ID	u2			
Length	u2	1 byte		
TOW	u4	0.001 s	4294967295	Receiver time stamp, see 4.1.3
WNc	u2	1 week	65535	neceiver time stamp, see 4.1.5
SourceCRS	c1[32]			Name of the source Coordinate Reference System, right-padded with zeros.
TargetCRS	c1[32]			Name of the target Coordinate Reference System, right-padded with zeros.
Datum	u1			See the Datum field in the PosLocal and PosProjected SBF blocks.
				Datum is set to 255 if this SourceCRS/TargetCRS pair is currently not used by the receiver.
HeightType	u1			Height Indicator field from MT1021 and MT1022. This field indicates how to interpret the height reported in the PosLocal and the PosProjected SBF blocks: 0: Geometrical height 1: Physical height (height definition in target CRS) 2: Physical height (height definition in source CRS)
QualityInd	u1			Bit field indicating the maximum approximation error after applying the transformation: Bits 0-3: horizontal quality indicator: 0: Unknown quality 1: Quality better than 21 mm (from MT1021/1022) 2: Quality 21 to 50 mm (from MT1021/1022) 3: Quality 51 to 200 mm (from MT1021/1022) 4: Quality 201 to 500 mm (from MT1021/1022) 5: Quality 501 to 2000 mm (from MT1021/1022) 6: Quality 2001 to 5000 mm (from MT1021/1022) 7: Quality worse than 5001 mm (from MT1021/1022) 9: Quality 0 to 10 mm (from MT1023/1024) 10: Quality 11 to 20 mm (from MT1023/1024) 11: Quality 21 to 50 mm (from MT1023/1024) 12: Quality 51 to 100 mm (from MT1023/1024) 13: Quality 101 to 200 mm (from MT1023/1024) 14: Quality 201 to 500 mm (from MT1023/1024) 15: Quality worse than 501 mm (from MT1023/1024) 15: Quality indicator, same definition as bits 0-3.
Padding	u1[]			Padding bytes, see 4.1.5

4.2.15 L-Band Demodulator Blocks

LBandTrackerStatus	Number:	4201	
	"OnChange"	interval: 1s	

The $\verb|LBandTrackerStatus|$ block provides general information on the tracking status of the L-band signals.

Parameter	Туре	Units	Do-Not-Use	Description	
Sync1	c1				
Sync2	c1				
CRC	u2			Block Header, see 4.1.1	
ID	u2				
Length	u2	1 byte			
TOW	u4	0.001 s	4294967295	95 Receiver time stamp, see 4.1.3	
WNc	u2	1 week	65535	Receiver time stamp, see 4.1.5	
N	u1			Number of L-band trackers for which data is provided in this SBF block, i.e. number of TrackData sub-blocks.	
SBLength	u1	1 byte		Length of one sub-block	
TrackData				A succession of N TrackData sub-blocks, see definition below	
Padding	u1[]			Padding bytes, see 4.1.5	

TrackData sub-block definition:

Parameter	Туре	Units	Do-Not-Use	Description
Frequency	u4	1 Hz	0	Nominal frequency of the beam for which data is provided in this sub-block.
Baudrate	u2	1 baud	0	Baudrate of the beam
ServiceID u2	u2			Service ID of the beam. Set to 0 for the LBAS1 beam. Set to 1 for the LBAS2 beam when received through an NTRIP connection.
				This field must be ignored if the Status field is set to anything else than 3 (Locked).
FreqOffset	f4	1 Hz	-2·10 ¹⁰	Frequency offset of the demodulator, if available
CN0	u2	0.01 dB-Hz	0	Current C/N ₀ value
AvgPower	i2	0.01 dB	-32768	Not applicable.
AGCGain	i1	1 dB	-128	L-band AGC gain, in dB.
Mode	u1			Current operation mode: 0: normal
Status	u1			Current status: 0: Idle 1: Search 2: FrameSearch 3: Locked
SVID	u1			Satellite ID, see 4.1.9
LockTime	u2	1 s		Lock time to the L-band signal, clipped to 65535 seconds.
Source	u1			L-band tracking module: 0: Unknown 1: Internal 2: LBR board 3: NTRIP. L-band data received over NTRIP. In that case, the other fields in this sub-block are not applicable and set to their Do-Not-Use value.
Padding	u1[]			Padding bytes, see 4.1.5

LBandBeams	Number:	4204
	"OnChange"	interval: Block generated each time beam status data is de-
		coded

This block contains the name, longitude and beam frequency of the L-band geostationary satellites known by the receiver.

Parameter	Туре	Units	Do-Not-Use	Description
Sync1	c1			
Sync2	c1			
CRC	u2			Block Header, see 4.1.1
ID	u2			
Length	u2	1 byte		
TOW	u4	0.001 s	4294967295	Receiver time stamp, see 4.1.3
WNc	u2	1 week	65535	Neceiver time stamp, see 4.1.5
N	u1			Number of L-band beams for which data is provided in this SBF block, i.e. number of BeamInfo sub-blocks.
SBLength	u1	1 byte		Length of one sub-block
BeamInfo				A succession of N BeamInfo sub-blocks, see definition below
Padding	u1[]			Padding bytes, see 4.1.5

BeamInfo sub-block definition:

Parameter	Туре	Units	Do-Not-Use	Description
SVID	u1			SVID associated to the satellite for which information is provided in this sub-block. SVID ranges from 107 to 119. See also section 4.1.9.
SatName	c1[9]			Satellite Name, right padded with zeros
SatLongitude	i2	0.01 degrees	-32768	Satellite Longitude (positive east of Greenwich)
BeamFreq	u4	1 Hz	0	L-band beam center frequency
Padding	u1[]			Padding bytes, see 4.1.5

LBandRaw	Number:	4212	
	"OnChange"	interval: "output each time new data is available"	

This block contains the raw user data from an L-band beam. Note that the block may be empty for beams transmitting proprietary data.

Parameter	Туре	Units	Do-Not-Use	Description

4.2.16 Status Blocks

ChannelStatus	Number:	4013
	"OnChange"	interval: default PVT output rate (see 4.1.8)

This block describes the current satellite allocation and tracking status of the active receiver channels. Active channels are channels to which a satellite has been allocated.

This block uses a two-level sub-block structure analogous to that of the MeasEpoch block. For each active channel, a ChannelSatInfo sub-block contains all satellite-dependent information such as health, azimuth and elevation. Each of these sub-blocks contains N2 ChannelStateInfo sub-blocks, N2 being the number of active antennas in a given channel (for single-antenna receivers, N2 is one). The ChannelStateInfo reports information such as the tracking status and PVT usage of a given signal type tracked on a given antenna.

Inactive channels are not contained in the Channel Status block.

Health, tracking and PVT status fields are available for each satellite. These status fields consist of a sequence of up to 8 two-bit fields. Each 2-bit field contains the status of one of the signals transmitted by the satellite. The position of the 2 bits corresponding to a given signal is dependent on the constellation, but is otherwise fixed. It is indicated in the tables below.

TOW	u4	0.001 s	4294967295	Receiver time stamp, see 4.1.3
WNc	u2	1 week	65535	Receiver time stamp, see 4.1.5
N	u1			Number of channels for which status are provided in this SBF block, i.e. number of ChannelSatInfo sub-blocks. If N is 0, there are no active channels available for this epoch.
SB1Length	u1	1 byte		Length of a ChannelSatInfo sub-block, excluding the nested ChannelStateInfo sub-blocks
SB2Length	u1	1 byte		Length of a ChannelStateInfo sub-block
Reserved	u1[3]			Reserved for future use, to be ignored by decoding software
SatInfo				A succession of N ChannelSatInfo sub-blocks, see definition below
Padding	u1[]			Padding bytes, see 4.1.5

ChannelSatInfo sub-block definition:

Parameter	Туре	Units	Do-Not-Use	Description
SVID	u1		0	Satellite ID, see 4.1.9. If zero, the satellite ID is not available in this field, but can be found in the SVIDFull field instead.
FreqNr	u1		0	For GLONASS satellites, this is the frequency number, with an offset of 8. It ranges from 1 (corresponding to an actual frequency number of -7) to 14 (corresponding to an actual frequency number of 6). Otherwise, $FreqNr$ is reserved and must be ignored by the decoding software.
SVIDFull	u2			If the ${\tt SVID}$ field is zero, this field contains the satellite ID (see 4.1.9). If ${\tt SVID}$ is not zero, this field should be ignored.
Azimuth/RiseSet	u2	1 degree	511	bit field: Bits 0-8: Azimuth [0,359]. 0 is North, and Azimuth increases towards East. Bits 9-13: Reserved Bits 14-15: Rise/Set Indicator: 0: Satellite setting
				1: Satellite rising 3: Elevation rate unknown
HealthStatus	u2			Sequence of 2-bit health status fields, each of them taking one of the following values: 0: health unknown, or not applicable 1: healthy 3: unhealthy The 2-bit health status is a condensed version of the health status as sent by the satellite. For SBAS, the health status is set from the almanac data (MT17).
Elevation	i1	1 degree		Elevation [-90,90] relative to local horizontal plane
N2	u1	3		Number of ChannelStateInfo blocks following this ChannelSatInfo block. There is one ChannelStateInfo subblock per antenna.
RxChannel	u1			Channel number, see section 4.1.11.
Reserved2	u1			Reserved for future use, to be ignored by decoding software.
Padding	u1[]			Padding bytes, see 4.1.5
StateInfo				A succession of N2 Channel State Info sub-blocks, see definition below

ChannelStateInfo sub-block definition:

Parameter	Туре	Units	Description
Antenna	u1		Antenna number (0 for main antenna)
Reserved	u1		Reserved for future use, to be ignored by decoding software
TrackingStatus	u2		Sequence of 2-bit tracking status fields, each of them taking one of the following values: 0: idle or not applicable 1: Search 2: Sync 3: Tracking
PVTStatus	u2		Sequence of 2-bit PVT status fields, each of them taking one of the following values: 0: not used 1: waiting for ephemeris 2: used 3: rejected
PVTInfo	u2		Internal info
Padding	u1[]	·	Padding bytes, see 4.1.5

ReceiverStatus	Number:	4014
	"OnChange"	interval: 1s

The ReceiverStatus block provides general information on the status of the receiver.

Parameter	Туре	Units	Do-Not-Use	Description					
Sync1	c1								
Sync2	c1								
CRC	u2			Block Header, see 4.1.1					
ID	u2								
Length	u2	1 byte							
TOW	u4	0.001 s	4294967295	Receiver time stamp, see 4.1.3					
WNc	u2	1 week	65535	Receiver time stamp, see 4.1.5					
CPULoad	u1	1 %	255	Load on the receiver's CPU. The load should stay below 80% in normal operation. Higher loads might result in data loss.					
ExtError	u1			Bit field reporting external errors, i.e. errors detected in external data. Upon detection of an error, the corresponding bit is set for a duration of one second, and then resets. Bit 0: SISERROR: set if a violation of the signal-in-space ICD has been detected for at least one satellite while that satellite is reported as healthy. Use the command "lif, SisError" for details. Bit 1: DIFFCORRERROR: set when an anomaly has been detected in an incoming differential correction stream, causing the receiver to fail to decode the corrections. Use the command "lif,DiffCorrError" for details. Bit 2: EXTSENSORERROR: set when a malfunction has been detected on at least one of the external sensors connected to the receiver. Use the command "lif, ExtSensorError" for details. Bit 3: SETUPERROR: set when a configuration/setup error has been detected. An example of such error is when a remote NTRIP Caster is not reachable. Use the command "lif, SetupError" for details. Bits 4-7: Reserved					
UpTime	u4	1 s		Number of seconds elapsed since the start-up of the receiver, or since the last reset.					

u4		Bit field ir	ndicating the status of key components of the receiver:
		Bit 0:	Reserved
		Bit 1:	ACTIVEANTENNA: this bit is set when an active GNSS antenna is sensed, i.e. when current is drawn from the antenna connector.
		Bit 2:	EXT_FREQ: this bit is set if an external frequency reference is detected at the 10 MHz input, and cleared if the receiver uses its own internal clock.
		Bit 3:	EXT_TIME: this bit is set if a pulse has been detected on the TimeSync input.
		Bit 4:	WNSET: see corresponding bit in the SyncLevel field of the ReceiverTime block.
		Bit 5:	TOWSET: see corresponding bit in the SyncLevel field of the ReceiverTime block.
		Bit 6:	FINETIME: see corresponding bit in the SyncLevel field of the ReceiverTime block.
		Bit 7:	INTERNALDISK_ACTIVITY: this bit is set for one second each time data is logged to the internal disk (DSK1). If the logging rate is larger than 1 Hz, set continuously.
		Bit 8:	INTERNALDISK_FULL: this bit is set when the internal disk (DSK1) is full. A disk is full when it is filled to 95% of its total capacity.
		Bit 9:	INTERNALDISK_MOUNTED: this bit is set when the internal disk (DSK1) is mounted.
		Bit 10:	INT_ANT: this bit is set when the GNSS RF signal is taken from the internal antenna input, and cleared when it comes from the external antenna input (only applicable on receiver mod- els featuring an internal antenna input).
		Bit 11:	REFOUT_LOCKED: if set, the 10-MHz frequency provided at the REF OUT connector is locked to GNSS time. Otherwise it is free-running.
		Bit 12:	Reserved
		Bit 13:	EXTERNALDISK_ACTIVITY: this bit is set for one second each time data is logged to the external disk (DSK2). If the logging rate is larger than 1 Hz, set continuously.
		Bit 14:	EXTERNALDISK_FULL: this bit is set when the external disk (DSK2) is full. A disk is full when it is filled to 95% of its total capacity.
		Bit 15:	EXTERNALDISK_MOUNTED: this bit is set when the external disk (DSK2) is mounted.
		Bit 16:	PPS_IN_CAL: this bit is set when PPS IN delay calibration is ongoing. Only applicable to PolaRx5TR receivers.
		Bit 17:	DIFFCORR_IN: this bit is set for one second each time differential corrections are decoded. If the input rate is larger than 1 Hz, set continuously.
		Bit 18:	INTERNET: this bit is set when the receiver has Internet access. If not set, there is either no Internet access, or the receiver could not reliably determine the status.
		Bits 19-31	1: Reserved
	u4		Bit 0: Bit 1: Bit 2: Bit 3: Bit 4: Bit 5: Bit 6: Bit 7: Bit 8: Bit 9: Bit 10: Bit 11: Bit 12: Bit 13: Bit 14: Bit 15: Bit 16: Bit 17:

RxError	RxError u4				indicating whether an error occurred previously. If this field is all to zero, at least one error has been detected.	
				Bit 0:	Reserved	
				Bit 1:	Reserved	
				Bit 2:	Reserved	
				Bit 3:	SOFTWARE: set upon detection of a software warning or error. This bit is reset by the command "lif, error".	
				Bit 4:	WATCHDOG: set when the watchdog caused the last reboot.	
				Bit 5:	ANTENNA: set when antenna overcurrent condition is detected.	
				Bit 6:	CONGESTION: set when an output data congestion has been detected on at least one of the communication ports of the receiver during the last second.	
				Bit 7:	Reserved	
				Bit 8:	MISSEDEVENT: set when an external event congestion has been detected during the last second. It indicates that the receiver is receiving too many events on its EVENTx pins.	
				Bit 9:	CPUOVERLOAD: set when the CPU load is larger than 90%.	
				Bit 10:	INVALIDCONFIG: set if one or more configuration file (e.g. permissions) is invalid or absent.	
				Bit 11:	OUTOFGEOFENCE: set if the receiver is currently out of its permitted region of operation (geofencing).	
				Bit 12:	Reserved	
				Bit 13:	Reserved	
				Bit 14:	Reserved	
				Bit 15:	Reserved	
				Bit 16:	Reserved	
				Bits 17-3	1: Reserved	
N	u1			Number	of AGCState sub-blocks this block contains.	
SBLength	u1	1 byte		Length o	f a AGCState sub-block.	
CmdCount	u1		0	that char	nd cyclic counter, incremented each time a command is entered nges the receiver configuration. After the counter has reached sets to 1.	
Temperature	u1	1°C	0	Receiver temperature with an offset of 100. Remove 100 to get the temperature in degree Celsius.		
AGCState				A succession of N AGCState sub-blocks, see definition below		
Padding	u1[]			Padding bytes, see 4.1.5

InputLink	Number:	4090	
	"OnChange"	interval: 1s	

The InputLink block reports statistics of the number of bytes and messages received and accepted on each active connection descriptor.

Per connection descriptor, the receiver maintains two byte counters (NrBytesReceived and NrBytesAccepted) and two message counters (NrMsgReceived and NrMsgAccepted), which are reported in the sub-blocks. These counters provide useful information on the quality of the transmission link, and of the bandwidth efficiency.

These counters (as well as the age of the last message) are reset simultaneously on the following events:

- start-up of the receiver
- overflow of one of the counters
- change of input type
- deactivation of a connection descriptor, e.g. on disconnection of USB or IP ports.

There is one sub-block per connection descriptor for which statistics is available.

				If the age	is older than 65534s, it is clipped to 65534s.	
NrBytesReceived	u4	1 byte	4294967295	Total nun	nber of bytes received ⁽⁶⁾	

NrBytesAccepted	u4	1 byte	Total number of bytes ⁽⁶⁾ in messages that passed the check for this type of input (CRC, parity check,). The ratio of NrBytesAccepted to NrBytesReceived gives an indication of the quality of the communication link.
NrMsgReceived	u4	1 message	Total number of messages of type Type received.
NrMsgAccepted	u4	1 message	Total number of messages of type \mathtt{Type} that were interpreted and used by the receiver.
			The ratio of ${\tt NrMsgAccepted}$ to ${\tt NrMsgReceived}$ gives an indication of the bandwidth usage efficiency
Padding	u1[]		Padding bytes, see 4.1.5

⁽⁶⁾ Note that, for RTCM 2.x, one 8-bit byte contains 6 RTCM data bits.

OutputLink Number:	4091	
"OnChang	e" interval:1s	

The OutputLink block reports statistics of the number of bytes sent on each active connection descriptor.

Per connection descriptor, the receiver maintains two byte counters NrBytesProduced and NrBytesSent, which are reported in the sub-block. They provide an indication of the amount of data output and data lost on a given connection.

These counters are reset simultaneously on the following events:

- start-up of the receiver
- overflow of one of the counters
- deactivation of a connection descriptor, e.g. on disconnection of USB or IP ports
- change of COM port settings.

There is one <code>OutputStatsSub</code> sub-block per connection descriptor for which statistics is available. Each <code>OutputStatsSub</code> sub-block contains a number of <code>OutputTypeSub</code> sub-blocks. These sub-blocks indicate which data type has been output through the connection in question during the last second. If no output happened during the last second, there is no <code>OutputTypeSub</code> sub-block.

Parameter	Туре	Units	Description
CDIndex	u1		Index of the NTRIP connection (1 for NTR1, 2 for NTR2, etc) for which status is provided in this sub-block.
Status	u1		NTRIP client status: 0: Connection disabled 1: Initializing 2: Running, differential corrections are being received and the link statistics is available in the InputLink block. 3: Error detected, the error code is provided in the next field. 4: Retrying, client encountered an error, we are trying to reconnect. The error code is provided in the next field. 5: Disabled since the settings are a duplicate of another active NTRIP connection.
ErrorCode	u1		NTRIP error code: 0: No error 1: Initialization error (e.g. source table retrieval failure) 2: Authentication error 3: Connection error 4: Mountpoint does not exist 5: Mountpoint unavailable 6: Waiting for GGA 7: GGA sending disabled when required by mountpoint 8: Resolving host failed 9: Out of region 10: TLS setup error 11: TLS handshake error 12: TLS fingerprint error 13: TLS time not known 254: Unknown error
Info	u1		Bit field indicating miscellaneous info about the Connection status: Bit 0: TLS was used to make secure NTRIP connection if this bit is set
			Bits 1-7: Reserved
Padding	u1[]		Padding bytes, see 4.1.5

NTRIPServerStatus	Number:	4122	
	"OnChange"	interval: 1s	

This block reports the current status of the NTRIP server connections.

Parameter	Туре	Units	Do-Not-Use	Description
Sync1	c1			
Sync2	c1			
CRC	u2			Block Header, see 4.1.1
ID	u2			
Length	u2	1 byte		
TOW	u4	0.001 s	4294967295	Receiver time stamp, see 4.1.3
WNc	u2	1 week	65535	Receiver time stamp, see 4.1.5
N	u1			Number of NTRIP server connections for which status is provided in this block, i.e. number of NTRIPServerConnection sub-blocks.
SBLength	u1	1 byte		Length of one NTRIPServerConnection sub-block
NTRIPServerConnection				A succession of N NTRIPServerConnection sub-blocks, see definition below
Padding	u1[]			Padding bytes, see 4.1.5

NTRIPServerConnection sub-block definition:

Parameter	Type	Units	Description				
CDIndex	u1		Index of the NTRIP connection (1 for NTR1, 2 for NTR2, etc) for which status is provided in this sub-block.				
Status	u1		NTRIP server status: 0: Connection disabled 1: Initializing 2: Running, differential corrections are being sent and the link statistics is available in the OutputLink block. 3: Error detected, the error code is provided in the next field. 4: Error detected. Currently trying to reconnect. The error code is provided in the next field. 5: Disabled since the settings are a duplicate of another active NTRIP connection.				
ErrorCode	u1		NTRIP error code: 0: No error 1: Initialization error 2: Authentication error 3: Connection error 4: Mountpoint does not exist 5: Configuration conflict error 6: Resolving host failed 7: TLS setup error 8: TLS handshake error 9: TLS fingerprint error 10: TLS time not known 254: Unknown error				
Info	u1		Bit field indicating miscellaneous info about the Connection status: Bit 0: TLS was used to make secure NTRIP connection if this bit is set Bits 1-7: Reserved				
Padding	u1[]		Padding bytes, see 4.1.5				

IPStatus	Number:	4058							
	"OnChange"	interval: output	each	time	one	or	more	IPv4	parameters
		change							

This block contains information on the receiver's IPv4 Ethernet interface (hostname, IP address, gateway, netmask and MAC address).

Parameter	Туре	Units	Do-Not-Use	Description			
Sync1	c1						
Sync2	c1						
CRC	u2			Block Header, see 4.1.1			
ID	u2						
Length	u2	1 byte					
TOW	u4	0.001 s	4294967295	Receiver time stamp, see 4.1.3			
WNc	u2	1 week	65535	Receiver time stamp, see 4.1.5			
MACAddress	u1[6]			MAC address. The first byte corresponds to the MSB of the address.			
IPAddress	u1[16]			IPv4 address. The first 12 bytes are always set to 0, and the last 4 bytes contain the IPv4 IP address, or are set to zero if the IP address is not known or not applicable.			
Gateway	u1[16]			Gateway address. The first 12 bytes are always set to 0, and the last 4 bytes contain the IPv4 IP address, or are set to zero if the gateway address is not known or not applicable.			
Netmask	u1		255	Number of bits used to identify the network (CIDR notation).			
Reserved	u1[3]			Reserved for future use, to be ignored by decoding software.			
HostName	c1[32]			Receiver hostname on the Ethernet interface, or empty if not known.			
Padding	u1[]			Padding bytes, see 4.1.5			

Rev 1

DynDNSStatus Number: 4105
"OnChange" interval:1s

This block contains dynamic DNS (DynDNS) status information.

Parameter	Туре	Units	Do-Not-Use	Description
Sync1	c1			
Sync2	c1			
CRC	u2			Block Header, see 4.1.1
ID	u2			
Length	u2	1 byte		
TOW	u4	0.001 s	4294967295	Receiver time stamp, see 4.1.3
WNc	u2	1 week	65535	neceiver time stamp, see 4.1.5
Status	u1			DynDNS status: 0: DynDNS disabled 1: Updating IP address 2: IP address updated at the DynDNS server. DynDNS is ready to use. 254: Error detected, the error code is provided in the next field.
ErrorCode	u1			DynDNS error code: 0: No error 1: Unspecified error 2: Abusive update 3: User name and password mismatch 4: Not a credited user 5: Hostname is not a fully-qualified domain name 6: Hostname does not exist in this user account 7: Hostname blocked for update abuse 8: Bad agent 9: DNS error 10: DynDNS server problem or maintenance 11: DynDNS server not reachable
IPAddress	u1[16]			IPv4 address that has been registered at the DynDNS server. The first 12 bytes are always set to 0, and the last 4 bytes contain the IPv4 address, or are set to zero if the IPv4 address is not known or not applicable (e.g. because registration failed).
IPv6Address	u1[16]		All elements set to 0	IPv6 address that has been registered at the DynDNS server. All bytes are set to zero if the IPv6 address is not known or not applicable (e.g. because the receiver does not support IPv6 or registration failed).
Padding	u1[]			Padding bytes, see 4.1.5

QualityInd Number: 4082
"OnChange" interval:1s

The QualityInd block contains quality indicators for the main functions of the receiver. Each quality indicator is a value from 0 to 10, 0 corresponding to poor quality and 10 to very high quality.

Parameter	Туре	Units	Do-Not-Use	Description				
Sync1	c1							
Sync2	c1							
CRC	u2			Block Header, see 4.1.1				
ID	u2							
Length	u2	1 byte						
TOW	u4	0.001 s	4294967295	Receiver time stamp, see 4.1.3				
WNc	u2	1 week	65535	neceiver time stamp, see 4.1.5				
N	u1			Number of quality indicators contained in this block				
Reserved	u1			Reserved for future use, to be ignored by decoding software.				
Indicators	u2[N]			N successive quality indicators, coded as follows:				
			All elements set to 15	Bits 0-7: Quality indicator type: 0: Overall quality 1: GNSS signals from main antenna 2: GNSS signals from aux1 antenna 11: RF power level from the main antenna 12: RF power level from the aux1 antenna 21: CPU headroom 25: OCXO stability (only available on PolaRx5S receivers) 29: Scintillation score. This score is inversely proportional to the severity of the detected ionosphere scintillation. A high value indicates the absence of scintillation. 30: Base station measurements. This indicator is only available in RTK mode. A low value could for example hint at severe multipath or interference at the base station, or also at ionospheric scintillation. 31: RTK post-processing. This indicator is only available when the position mode is not RTK. It indicates the likelihood of getting a cmaccurate RTK position when post-processing the current data. Bits 8-11: Value of this quality indicator (from 0 for low quality to 10 for high quality, or 15 if unknown) Bits 12-15: Reserved for future use, to be ignored by decoding software.				
Padding	u1[]			Padding bytes, see 4.1.5				

DiskStatus	Number:	4059	
	"OnChange"	interval: 1s	

This block reports the size and usage of the disks mounted on the receiver.

Parameter	Туре	Units	Do-Not-Use	Description
Sync1	c1			
Sync2	c1			
CRC	u2			Block Header, see 4.1.1
ID	u2			
Length	u2	1 byte		
TOW	u4	0.001 s	4294967295	Receiver time stamp, see 4.1.3
WNc	u2	1 week	65535	Receiver time stamp, see 4.1.5
N	u1			Number of DiskData sub-blocks this block contains.
SBLength	u1	1 byte		Length of one DiskData sub-blocks in bytes.
Reserved	u1[4]			Reserved for future use
DiskData				A succession of N DiskData sub-blocks, see definition below
Padding	u1[]			Padding bytes, see 4.1.5

DiskData sub-block definition:

	Parameter	Туре	Units	Do-Not-Use	Description
	DiskID	u1			ID of the disk, starting at 1 for the internal SD Memory Card.
	Status	u1			Bit field:
					Bit 0: DISK_MOUNTED: bit set when the disk is mounted.
					Bit 1: DISK_FULL: bit set when the disk is full. A disk is full when it is filled to 95% of its total capacity.
					Bit 2: DISK_ACTIVITY: bit set for one second each time data is writ- ten to the disk. If the logging rate is larger than 1 Hz, set con- tinuously.
_					Bit 3: LOGGING_ENABLED: bit set when at least one file is open on the disk, regardless of the logging rate. Bit 4: MOUNTING: bit set when disk is being mounted.
					Bit 5: FORMATTING: bit set when disk is being formatted.
'					Bits 6-7: Reserved
	DiskUsageMSB	u2		65535 ⁽⁷⁾	16 MSB of the total disk usage. The disk usage in bytes is given by DiskUsageMSB*4294967296+DiskUsageLSB.
	DiskUsageLSB	u4		4294967295 ⁽⁷⁾	32 LSB of the total disk usage. The disk usage in bytes is given by DiskUsageMSB*4294967296+DiskUsageLSB.
	DiskSize	u4	1 Mbyte	0	Total size of the disk, in megabytes.
	CreateDeleteCount	u1			Counter incremented by one each time a file or a folder is created or deleted on this disk. This counter starts at zero at receiver start-up and restarts at zero after having reached 255.
	Error	u1		255	Disk error: 0: No error 1: Disk partition is too large 2: Disk does not have any partition 3: File system check and recovery failed 4: Disk in use over USB 254: Disk mount failed due to unknown error
	Padding	u1[]			Padding bytes, see 4.1.5

 $^{^{(7)} \}quad \text{The disk usage is invalid if both } \texttt{DiskUsageMSB} \text{ is } 65535 \text{ and } \texttt{DiskUsageLSB} \text{ is } 4294967295.$

RFStatus	Number:	4092
	"OnChange"	interval: 1s

The RFStatus block reports on the quality of the radio-frequency (RF) signal received by the antenna(s). The RFBand sub-blocks provide a list of the frequency bands where interferences have been detected and/or mitigated, and the Flags field contains warnings that the receiver's output may be affected by non-authentic RF signals.

Parameter	Туре	Units	Do-Not-Use	Description	
Sync1	c1				
Sync2	c1				
CRC	u2			Block Header, see 4.1.1	
ID	u2				
Length	u2	1 byte			
TOW	u4	0.001 s	4294967295	Receiver time stamp, see 4.1.3	
WNc	u2	1 week	65535	Receiver time stamp, see 4.1.5	
N	u1			Number of RF bands for which data is provided in this SBF block, i.e. number of RFB and sub-blocks.	
SBLength	u1	1 byte		Length of one sub-block	
Flags	u1			Bit field:	
				Bit 0: Set when the receiver determined that the GNSS signals at its RF connector may not be authentic and that its output (position or raw measurements) may therefore be misleading. The receiver may be connected to a GNSS simulator, or be subject to a spoofing attack. This bit is based on a set of built-in tests to check the authenticity of the GNSS signals. In addition to those tests, Navigation Message Authentication (NMA) is performed as well. If NMA verification fails, bit 1 is set instead. Note that bit 0 may be set even if no interference is detected (i.e. with no associated RFBand sub-blocks). Bit 1: Set when a non-authentic navigation message is detected by NMA checks (e.g. Galileo OSNMA or Fugro AtomiChron NMA).	
Reserved	u1[3]			Reserved for future use, to be ignored by decoding software.	
RFBand				A succession of N RFBand sub-blocks, see definition below	
Padding	u1[]			Padding bytes, see 4.1.5	

RFBand sub-block definition:

Parameter	Туре	Units	Do-Not-Use	Description	
Frequency	u4	1 Hz		Center frequency of the RF band addressed by this sub-block.	
Bandwidth	u2	1 kHz		Bandwidth of the RF band.	
Info	u1			Info on this RF band:	
				Bits 0-3: Mode:	
				1: This RF band is suppressed by a notch filter set manually by user command. 2: The receiver detected interference in this band, and successfully canceled it. 8: The receiver detected interference in this band. No mitigation applied. Bits 4-5: Reserved Bits 6-7: Antenna ID: 0 for main, 1 for Aux1 and 2 for Aux2	
Power	i1	1 dBm	O Estimated interference power in this band. Set to 0 if the power could not be estimated or for bands corresponding to manual notch filters.		

Padding	u1[]	, and the second	Padding bytes, see 4.1.5

P2PPStatus	Number:	4238	
	"OnChange"	interval: 1s	

This block reports the status of the active P2PP (Point-to-Point Protocol) sessions. See the **setPointToPoint** command for details.

Parameter	Туре	Units	Do-Not-Use	Description
Sync1	c1			
Sync2	c1			
CRC	u2			Block Header, see 4.1.1
ID	u2			
Length	u2	1 byte		
TOW	u4	0.001 s	4294967295	Receiver time stamp, see 4.1.3
WNc	u2	1 week	65535	Neceiver time stamp, see 4.1.5
N	u1			Number of active P2PP sessions for which status is provided in this block, i.e. number of P2PPSession sub-blocks.
SBLength	u1	1 byte		Length of one P2PPSession sub-block
P2PPSession				A succession of N P2PPSession sub-blocks, see definition below
Padding	u1[]			Padding bytes, see 4.1.5

P2PPSession sub-block definition:

Parameter	Туре	Units	Description		
SessionID	u1		Index of the P2PP session (1 for P2PP1, 2 for P2PP2, etc) for which status is provided in this sub-block.		
Port	u1		Index for the COM port the P2PP session is configured on (1 for COM1, 2 for COM2, etc).		
Status	u1		Bit field: Bit 0: Mode: Bit set if the P2PP session is in Server mode, and unset if it is in Client mode (future functionality). Bits 1-7: P2PP status: 0: Initializing 1: Waiting for Connection 2: Connected 3: Disconnecting 4: Error, see ErrorCode field below		
ErrorCode	u1		4: Error, see ErrorCode field below P2PP error: 1: No error 2: Configuration 3: Port Acquisition 4: Port Lock 5: Start Daemon 6: Server Authentication 7: Client Authentication 8: Timeout on Activity 9: Timeout on Negotiation 10: Link Negotiation 255: Unspecified		
Padding	u1[]		Padding bytes, see 4.1.5		

GALAuthStatus	Number:	4245	
	"OnChange"	interval: 1s	

The ${\tt GALAuthStatus}$ block contains the current status of the Galileo OSNMA authentication.

Parameter	Туре	Units	Do-Not-Use	Description	
Sync1	c1				
Sync2	c1				
CRC	u2			Block Header, see 4.1.1	
ID	u2				
Length	u2	1 byte			
TOW	u4	0.001 s	4294967295	Descriver time stamp, see 4.1.2	
WNc	u2	1 week	65535	Receiver time stamp, see 4.1.3	
OSNMAStatus	u2		255	Bit field: Bits 0-2: status: 0: Disabled 1: Initializing 2: Waiting for trusted time information 3: Init failed - inconsistent time 4: Init failed - KROOT signature invalid 5: Init failed - invalid param received 6: Authenticating Bits 3-10: OSNMA initialization progress, expressed in percent [0-100]. This value will only be encoded when the OSNMA Status is initializing. A value of 255 indicates an alert condition of the OSNMA operation resulting in OSNMA not being available. Bits 11-13: Trusted time source: 0: NTP 1: L-Band 2: Command 7: Unknown Bit 14: Indicates if the Merkle tree renewal is in progress: 0: No 1: Yes Bit 15: Reserved	
TrustedTimeDelta	f4	1 s	-2·10 ¹⁰	Time difference between external trusted and receiver time, positive when receiver time lags trusted time.	
GalActiveMask	u8			Bit field indicating the Galileo satellites for which OSNMA results are available. If bit i is set, OSNMA authentication is available for Galileo satellite $i+1$.	
GalAuthenticMask	u8			Bit field indicating the Galileo satellites successfully authenticated by OSNMA. If bit <i>i</i> is set, the navigation message from Galileo satellite <i>i</i> +1 is authentic. If bit <i>i</i> is not set and the corresponding bit is set in GalActiveMask, the navigation message from that satellite is non-authentic.	
GpsActiveMask	u8			Bit field indicating the GPS satellites for which OSNMA results are available. If bit i is set, OSNMA authentication is available for GPS satellite i +1.	
GpsAuthenticMask	u8			Bit field indicating the GPS satellites successfully authenticated by OSNMA. If bit <i>i</i> is set, the navigation message from GPS satellite <i>i</i> +1 is authentic. If bit <i>i</i> is not set and the corresponding bit is set in GpsActiveMask, the navigation message from that satellite is non-authentic.	
Padding	u1[]			Padding bytes, see 4.1.5	

4.2.17 Miscellaneous Blocks

ReceiverSetup	Number:	5902
	"OnChange"	interval: Block generated every 60 seconds and each
		time a user-command is entered to change
		one or more values in the block (e.g. when
		entering the setMarkerParameters com-
		mand)

The ReceiverSetup block contains parameters related to the receiver and its installation. When generating RINEX files, this block defines the RINEX file name and the contents of the header.

For all fields containing a string, if the length of the string is lower than the size of the corresponding field, the unused bytes are set to zero.

Parameter	Туре	Units	Do-Not-Use	Description	
Sync1	c1				
Sync2	c1				
CRC	u2			Block Header, see 4.1.1	
ID	u2				
Length	u2	1 byte			
TOW	u4	0.001 s	4294967295	Receiver time stamp, see 4.1.3	
WNc	u2	1 week	65535	receiver time stamp, see 4.7.5	
Reserved	u1[2]			2 bytes reserved for future use, to be ignored by decoding software	
MarkerName	c1[60]			Marker name (set with setMarkerParameters).	
MarkerNumber	c1[20]			Marker number (set with setMarkerParameters).	
Observer	c1[20]			Observer name (set with setObserverParameters).	
Agency	c1[40]			Observer agency (set with setObserverParameters).	
RxSerialNumber	c1[20]			Receiver serial number.	
RxName	c1[20]			Receiver GNSS engine name.	
RxVersion	c1[20]			Receiver firmware version.	
AntSerialNbr	c1[20]			Serial number of the main antenna (set with setAntennaOffset).	
AntType	c1[20]			Type of the main antenna (set with setAntennaOffset).	
deltaH	f4	1 m		δ H offset of the main antenna (set with setAntennaOffset).	
deltaE	f4	1 m		δE offset of the main antenna (set with setAntennaOffset).	
deltaN	f4	1 m		δ N offset of the main antenna (set with setAntennaOffset).	
MarkerType	c1[20]			Marker type (set with the setMarkerParameters command).	
GNSSFWVersion	c1[40]			Version the firmware installed on the receiver.	
ProductName	c1[40]			Product name.	
Latitude	f8	1 rad	-2·10 ¹⁰	Latitude of the reference position, from $-\pi/2$ to $+\pi/2$, positive North of Equator. Use the setPVTMode command to set the reference position.	
Longitude	f8	1 rad	-2·10 ¹⁰	Longitude of the reference position, from $-\pi$ to $+\pi$, positive East of Greenwich. Use the setPVTMode command to set the reference position.	
Height	f4	1 m	-2·10 ¹⁰	Ellipsoidal height of the reference position (with respect to WGS84 ellipsoid). Use the setPVTMode command to set the reference position.	
StationCode	c1[10]			Station code (set with setMarkerParameters). This field can for example contains the four-letter IGS station code assigned to the receiver.	
MonumentIdx	u1			Monument index (set with setMarkerParameters). This index is used to identify the monument when there are multiple monuments at the same station.	
ReceiverIdx	u1			Receiver index (set with setMarkerParameters). This index is used to identify the receiver when there are multiple receivers at the same monument.	
CountryCode	c1[3]			ISO 3-character country code (set with the setMarkerParameters command).	
Reserved1	c1[21]			Reserved.	
Padding	u1[]			Padding bytes, see 4.1.5

Rev 1 Rev 2 Rev 3

RxMessage	Number:	4103	
	"OnChange"	interval: block generated	each time a message needs to be
		sent	

The receiver generates ASCII messages to help users follow the progress of processes such as file logging or FTP push (activity log). These messages are output in the RxMessage block, and they can also be retrieved from the command line using the lif, RxMessages command.

Parameter	Туре	Units	Do-Not-Use	Description
Sync1	c1			
Sync2	c1			
CRC	u2			Block Header, see 4.1.1
ID	u2			
Length	u2	1 byte		
TOW	u4	0.001 s	4294967295	Receiver time stamp, see 4.1.3
WNc	u2	1 week	65535	receiver time stamp, see 4.1.5
Type	u1		255	Type of message contained in this block: 1: Asynchronous command reply 2: Message about internal logging 3: Message about FTP push 4: Message about Receiver Status 5: Message from slave GNSS receiver 6: Message about CloudIt
Severity	u1		255	Message severity: 1: Info 2: Warning 3: Error
MessageID	u4		0	A unique value associated to each message. This is a counter starting at 1 for the first message after boot and incrementing at each message.
StringLn	u2			Length of Message in characters, including the terminating \0.
Reserved2	u1[2]			Reserved, contents to be ignored.
Message	c1[StringLn]			Receiver message terminated by \0.
Padding	u1[]			Padding bytes, see 4.1.5

Commands	Number:	4015	
	"OnChange"	interval: each time a user command is entered	

Every time the user sends a command, a Commands block is output on all ports for which this block is enabled. The Commands SBF block is inserted in the SBF stream at the very moment when the command starts to take effect.

Parameter	Туре	Units	Do-Not-Use	Description
Sync1	c1			
Sync2	c1			
CRC	u2			Block Header, see 4.1.1
ID	u2			
Length	u2	1 byte		
TOW	u4	0.001 s	4294967295	Receiver time stamp, see 4.1.3
WNc	u2	1 week	65535	Receiver time stamp, see 4.1.5
Reserved	u1[2]			Reserved for future use, to be ignored by decoding software.
CmdData	u1[<i>N</i>]			Command data, this is the command in the SNMP' format (reserved for maintenance and support only). Beware that strings of characters are encoded as plaintext. No obfuscation takes place.
Padding	u1[]			Padding bytes, see 4.1.5

Comment	Number:	5936]
	"OnChange"	interval: block generated each time a comment is entered with	l
		setObserverComment	ı

The Comment block contains a comment string as entered with the **setObserverComment** command.

Parameter	Туре	Units	Do-Not-Use	Description
Sync1	c1			
Sync2	c1			
CRC	u2			Block Header, see 4.1.1
ID	u2			
Length	u2	1 byte		
TOW	u4	0.001 s	4294967295	Receiver time stamp, see 4.1.3
WNc	u2	1 week	65535	neceiver time stamp, see 4.1.5
CommentLn	u2			Length of the Comment string, in characters. The maximum length of a comment is 120 characters.
Comment	c1[CommentLn]			Comment string, as entered with the setObserverComment command. Note that this string is not terminated by the "\0" character.
Padding	u1[]			Padding bytes, see 4.1.5

BBSamples	Number:	4040
	"OnChange"	interval: block generated each time new baseband samples
		are ready (typically at 2Hz)

The BBSamples block contains a series of successive complex baseband samples. These samples can be used for signal monitoring and for spectral analysis of the GNSS bands supported by the receiver.

Parameter	Туре	Units	Do-Not-Use	Description
Sync1	c1			
Sync2	c1			
CRC	u2			Block Header, see 4.1.1
ID	u2			
Length	u2	1 byte		
TOW	u4	0.001 s	4294967295	External time stamp, see 4.1.3
WNc	u2	1 week	65535	External time stamp, see 4.1.5
N	u2			Number of complex baseband samples contained in this block
Info	u1			Bit field as follows:
				Bits 0-2: Antenna ID: antenna from which the samples have been taken: 0 for main, 1 for <i>Aux1</i> and 2 for <i>Aux2</i> . Bits 3-7: Reserved
Reserved	u1[3]			Reserved for future use, to be ignored by decoding software.
SampleFreq	u4	1 Hz		Sampling frequency in Hz.
LOFreq	u4	1 Hz		Frequency of the local oscillator (LO) used to down-convert the RF signal to baseband.
Samples	u2[N]			N successive complex baseband samples (I+jQ), coded as follows:
				Bits 0-7: 8-bit Q component, two's complement.
				Bits 8-15: 8-bit l component, two's complement.
TOWDelta	f4	1 s	-2·10 ¹⁰	Time offset from TOW. The time tag of the first sample in GNSS time scale, expressed in seconds, is given by TOW*0.001 + TOWDelta.
Padding	u1[]			Padding bytes, see 4.1.5

AS	CIIIn	Number:	4075	
		"OnChange"	interval: block generated each time an ASCII string is received	

The ASCIIIn block contains a string that has been received on one of the receiver's connection ports.

More specifically, this block is output each time an end-of-line character is received on a communication port configured to receive ASCIIIn input (with the **setDataInOut** command). The string reported in this block contains all characters received since the previous occurrence of an end-of-line character.

The maximum length of the string is 2000 characters. If there are more than 2000 characters between the occurrence of two successive end-of-line characters, the string is discarded

4.3 SBF Change Log

Date	Change Description
Apr 10, 2020	Added the NTRIPServerStatus block for the NTRIP server connection
	status
Feb 11, 2020	Added the BDSRawB2b block containing the raw BeiDou B2b navigation
	symbols
May 16, 2019	Added the P2PPStatus block to report the status of the Point-to-Point ses-
	sions
	Added the QZSAlm block containing QZSS almanac parameters
Apr 8, 2019	Renamed IRNSSRaw to NAVICRaw
Mar 12, 2019	Added the BDSAlm block containing BeiDou almanac parameters
Apr 19, 2018	Added the BDSRawB1C block containing the raw BeiDou B1C navigation
A = = 10, 2010	symbols
Apr 19, 2018	Added the BDSRawB2a block containing the raw BeiDou B2a navigation
Can 21 2017	symbols
•	Added the LBandRaw block containing raw L-Band data bytes
Jun 20, 2017	Added the BDSIon and BDSUtc blocks containing BeiDou ionospheric and
Jun 15, 2017	UTC offset parameters Added the Meas3PP and Meas3MP blocks to supplement the
Juli 13, 2017	Meas3Ranges block
Mar 6, 2017	Added the Meas3Ranges, Meas3CNOHiRes and Meas3Doppler blocks
10101 0, 2017	containing GNSS measurements
Mar 1, 2017	Renamed CMPNav to BDSNav and CMPRaw to BDSRaw
	Added the RxMessage block containing the receiver activity log
Feb 04, 2015	Added the QZSNav block containing decoded QZSS navigation data
Jan 13, 2015	Added the PosProjected block containing plane grid coordinates
Dec 12, 2014	Added the base measurements quality indicator
Nov 6, 2014	Added the RFStatus block for interference mitigation monitoring
· ·	Added new values for the Datum field
April 22, 2014	Added the DiskStatus block reporting the disk usage and free space of
' '	the disks available on the receiver
Feb 21, 2014	Added the NTRIPClientStatus block for the NTRIP client connection sta-
	tus
March 14, 2013	Added the QualityInd block containing various quality indicators
Feb 19, 2013	Added the CMPNav block containing decoded BeiDou navigation data
Feb 8, 2013	Fixed typo: field t_oG of GALGstGps changed to type u4 and units of sec-
	onds
Jan 8, 2013	Added fields HAccuracy, VAccuracy and Misc to the PVTCartesian
	and PVTGeodetic blocks
Dec 19, 2012	Added PRNs 139 and 140 to the list of SBAS satellites
Oct 25, 2012	Added RTCMDatum and PosLocal blocks
Oct 19, 2012	Added GEORawL5 block
Oct 1, 2012	Added new signal type for L-band and SBAS L5 signals (value 23 and 25)
Sep 29, 2012	Added LBandBeams block and added SVID field to
_	LBandTrackerStatus block
Sep 20, 2012	Added field PPPInfo to the PVTCartesian and PVTGeodetic blocks
Feb 28, 2012	Added GALSARRLM block
Feb 6, 2012	Added QZSS signals and QZSRawL1CA, QZSRawL2C and QZSRawL5 blocks

Appendix A

Attitude Angles

The attitude of the vehicle is defined as the angles between the vehicle reference frame and the local-level reference frame (defined by the East, North and Up directions). The vehicle reference frame is defined as follows. It is attached to the vehicle and has its X axis pointing along the longitudinal vehicle axis, the Y axis pointing towards the vehicle starboard (right) side and the Z axis pointing down, as illustrated in Figure A-1.

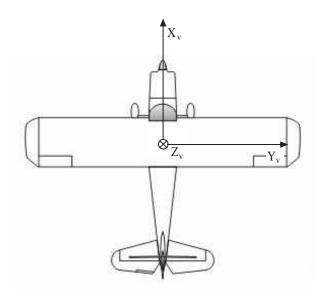

Figure A-1: Vehicle reference frame.

Septentrio receivers express the vehicle attitude in Euler angles using the heading-pitch-roll rotation sequence. More specifically, Euler angles are defined as successive rotations of the vehicle frame (X, Y, Z axes) relative to the local-level East-North-Up reference frame. The rotation sequence is shown in Figure A-2. The heading (ψ) of the vehicle is defined as the right-handed rotation of the vehicle about the Z axis ($0^o \le \psi \le 360^o$). The pitch (θ) of the vehicle is defined as the right-handed rotation about the vehicle Y axis ($-90^o \le \theta \le 90^o$). The roll (ϕ) of the vehicle is defined as the right-handed rotation about the vehicle X axis ($-180^o \le \phi \le 180^o$).

Starting from the situation where X points to the North, Y to the East and Z down, the following successive rotations define the attitude of the vehicle. Note that the order of the rotations is important.

- 1. Rotate through angle ψ about Z axis;
- 2. Rotate through angle θ about new Y axis;
- 3. Rotate through angle ϕ about new X axis;

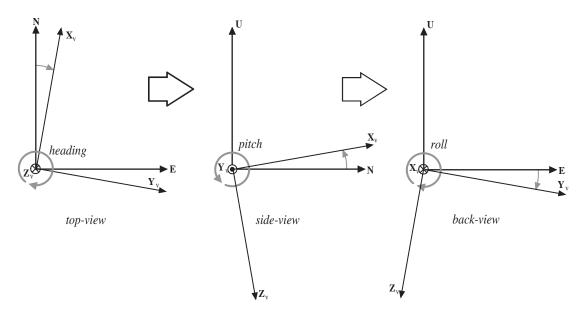

Figure A-2: Euler angle sequence.

Appendix B

List of SBF Blocks

The following table provides the list of the SBF block names and numbers available on mosaic-X5 and a short description of the associated contents. The block number is contained in bits 0 to 12 of the block ID field (see section 4.1.1).

The "Flex Rate" column indicates whether a given block can be output at a user-defined rate and the "esoc" column whether it can be used as an argument of the **exeSBFOnce** command (see also section 4.1.8). The "Time stamp" column indicates which type of time is encoded in the block time stamp (see section 4.1.3 for details).

Block name	Block	Content description	Flex	esoc	Time
	No		Rate		Stamp
Measurement Blocks					
MeasEpoch		Measurement set of one epoch	•	•	R
MeasExtra		Additional info such as observable variance	•	•	R
Meas3Ranges	4109	Code, phase and CN0 measurements	•	•	R

Appendix C

List of NMEA Sentences

The following table provides a list of the NMEA messages supported by your receiver. The first column is the message identifier to be used in the **setNMEAOutput** and the **exeNMEAOnce** commands.

For a full description of the NMEA messages, please refer to the NMEA 0183 standard.

Message Identifier	NMEA For- matter	Short Description	Comment
ALM	ALM	GPS Almanac Data	
AVR	AVR	Trimble Navigation proprietary \$PINL, AVR sentence	
DTM	DTM	Datum Reference	
GBS	GBS	GNSS Satellite Fault Detection	
GFA	GFA	GNSS Fix Accuracy and Integrity	
GGA	GGA	GPS Fix Data	
GGK	GGK	Trimble Navigation proprietary \$PINL, GGK sentence	
GGQ	GGQ	Leica Real-Time Position with CQ	
GLL	GLL	Geographic Position - Latitude/Longitude	
GMP	GMP	GNSS Map Projection Fix Data	
GNS	GNS	GNSS Fix Data	
GRS	GRS	GNSS Range Residuals	
GSA	GSA	GNSS DOP and Active Satellites	
GST	GST	GNSS Pseudorange Error Statistics	
GSV	GSV	GNSS Satellites in View	
HDT	HDT	Heading, True	
HRP	HRP	Heading, Roll, Pitch	Septentrio proprietary, see section C.1.1
LLK	LLK	Leica Local Position and GDOP	
LLQ	LLQ	Leica Local Position and Quality	
RBD	RBD	Rover-Base Direction	Septentrio proprietary, see section C.1.2
RBP	RBP	Rover-Base Position	Septentrio proprietary, see section C.1.3
RBV	RBV	Rover-Base Velocity	Septentrio proprietary, see section C.1.4
RMC	RMC	Recommended Minimum Specific GNSS Data	
ROT	ROT	Rate of Turn	
SNC	SNC	NTRIP Client Status	Septentrio proprietary, see section C.1.5
TFM	TFM	Used Coordinate Transformation Messages	Septentrio proprietary, see section C.1.6

Message Identifier	NMEA For- matter	Short Description	Comment
THS	THS	True Heading and Status	
TXTbase	TXT		Text from a base station in RTCM message type 1029. The text identifier is set to 1, and the text message is in the form "nnnn: <base txt=""/> ", where nnnn is the base station ID.
VTG	VTG	Course Over Ground and Ground Speed	
ZDA	ZDA	Time and Date	

Note: in sentences containing satellite-per-satellite data, data for BeiDou satellites are encoded using System ID 4 (BD) and satellite ID 1-36. Data for NavIC/IRNSS, QZSS and SBAS satellites with a PRN>151 are not encoded in NMEA.

Appendix C.1 Proprietary NMEA Sentences

C.1.1 HRP: Heading, Roll, Pitch

Field	Description
\$PSSN,HRP,	Start of sentence
hhmmss.ss,	UTC of HRP (HoursMinutesSeconds.DecimalSeconds)
xxxxxx,	Date: ddmmyy
x.x,	Heading, degrees True
x.x,	Roll, degrees
x.x,	Pitch, degrees
x.x,	Heading standard deviation, degrees
x.x,	Roll standard deviation, degrees
x.x,	Pitch standard deviation, degrees
xx,	Number of satellites used for attitude computation
х,	Mode indicator: 0: No attitude available 1: Heading, Pitch with float ambiguities 2: Heading, Pitch with fixed ambiguities 3: Heading, Pitch, Roll with float ambiguities 4: Heading, Pitch, Roll with fixed ambiguities 5: Heading, Pitch from velocity (dead-reckoning) 6: Heading, Pitch, Roll from non-RTK INS 7: Heading, Pitch, Roll from RTK INS 8: Heading, Pitch, Roll from INS coasting
x.x,a	Magnetic variation, degrees (E=East, W=West, see also the setMagneticVariance command)
*hh	Checksum delimiter and checksum field
<cr><lf></lf></cr>	End of sentence

C.1.2 RBD: Rover-Base Direction

Field	Description
\$PSSN,RBD,	Start of sentence
hhmmss.ss,	UTC of RBD (HoursMinutesSeconds.DecimalSeconds)
xxxxxx,	Date: ddmmyy
x.x,	Azimuth of the base as seen from rover (0 to 360 increasing towards east), degrees True
x.x,	Elevation of the base as seen from rover (-90 to 90), degrees
xx,	Number of satellites used for baseline computation
x, x,	Quality indicator: 0: Invalid 2: DPGS 4: RTK 5: Float RTK Base motion indicator: 0: Static base 1: Moving base
x.x,	Correction Age, seconds
С-С,	Rover serial number
xxxx	Base station ID
*hh	Checksum delimiter and checksum field
<cr><lf></lf></cr>	End of sentence

C.1.3 RBP: Rover-Base Position

Field	Description
\$PSSN,RBP,	Start of sentence
hhmmss.ss,	UTC of RBP (HoursMinutesSeconds.DecimalSeconds)
xxxxxx,	Date: ddmmyy
x.x,	North (True) baseline component (positive when base is north of rover), meters
x.x,	East baseline component (positive when base is east of rover), meters
x.x,	Up baseline component (positive when base is higher than rover), meters
xx,	Number of satellites used for baseline computation
	Quality indicator:
	0: Invalid
х,	2: DPGS
	4: RTK
	5: Float RTK
	Base motion indicator:
х,	0: Static base
	1: Moving base
x.x,	Correction Age, seconds
C-C,	Rover serial number
xxxx	Base station ID
*hh	Checksum delimiter and checksum field
<cr><lf></lf></cr>	End of sentence

C.1.4 RBV: Rover-Base Velocity

Field	Description
\$PSSN,RBV,	Start of sentence
hhmmss.ss,	UTC of RBV (HoursMinutesSeconds.DecimalSeconds)
xxxxxx,	Date: ddmmyy
x.x,	Rate of change of baseline vector (rover to base), north component, m/s
x.x,	Rate of change of baseline vector (rover to base), east component, m/s
x.x,	Rate of change of baseline vector (rover to base), up component, m/s
xx,	Number of satellites used for baseline computation
x, x,	Quality indicator: 0: Invalid 2: DPGS 4: RTK 5: Float RTK Base motion indicator: 0: Static base 1: Moving base
x.x,	Correction Age, seconds
C-C,	Rover serial number
xxxx	Base station ID
*hh	Checksum delimiter and checksum field
<cr><lf></lf></cr>	End of sentence

C.1.5 SNC: NTRIP Client Status

This proprietary sentence is the NMEA equivalent of the NTRIPClientStatus SBF block.

Field	Description
\$PSSN,SNC,	Start of sentence
[
x,	message revision
xxxxxxxxx,	time of week, milliseconds
xxxx,	week number
<sncsub></sncsub>	a succession of SNCSub sub-messages, see definition below
]	
*hh	Checksum delimiter and checksum field
<cr><lf></lf></cr>	End of sentence

SNCSub definition:

Field	Description
[
х,	CDIndex field of the NTRIPClientStatus SBF block
х,	Status field of the NTRIPClientStatus SBF block
х,	ErrorCode field of the NTRIPClientStatus SBF block
Х	Info field of the NTRIPClientStatus SBF block
]	

Example:

\$PSSN, SNC, [0, 379359000, 1840, [1, 2, 0, 0]] *68

C.1.6 TFM: Used RTCM Coordinate Transformation Messages

This proprietary sentence indicates which RTCM coordinate transformation messages have been received and used in the position computation.

Field	Description
\$PSSN,TFM,	Start of sentence
hhmmss.ss,	UTC time (HoursMinutesSeconds.DecimalSeconds)
х,	Height indicator, a copy of the Height Indicator field in RTCM message 1021 or 1022. Null if unknown.
xxxx,	Message 1021/1022 usage (they are exclusive). Possible field values: 1021: Message type 1021 used; 1022: Message type 1022 used; null: neither 1021 nor 1022 used.
xxxx,	Message 1023/1024 usage (they are exclusive). Possible field values: 1023: Message type 1023 used; 1024: Message type 1024 used; null: neither 1023 nor 1024 used.
xxxx	Message 1025/1026/1027 usage (they are exclusive). Possible field values: 1025: Message type 1025 used; 1026: Message type 1026 used; 1027: Message type 1027 used; null: neither 1025 nor 1026 nor 1027 used.
*hh	Checksum delimiter and checksum field
<cr><lf></lf></cr>	End of sentence

Example:

\$PSSN, TFM, 104751.00, 2, 1021, 1023, 1025 * 5F

Appendix D

List of Differential Correction Messages

This appendix provides a list of all the CMR and RTCM messages supported by the receiver.
